Seeing as everyone's top-posting ;-) .....

The Falcon and the STE are very different machines. The Falcon only has a few devices in common with the STE, the PSG sound and the keyboard/midi chips spring to mind. The CPU (68030) and the VIDEL (video shifter) are not in the STE but these chips can perform most of the STE's functions. All properly written software will work (IE if they use the GEMDOS/BIOS functions, and dont write directly to the hardware (like GAMES!)). Its not surprising really that most games wont run on the Falcon, in order to bring out a computer that was sufficiently ahead of the STE at the time, compromises in terms of compatibility had to be made.

To answer the question though, the only games software that will work on both platforms is either a Falcon game that has an ST/E mode, or an ST/E game that will work with Backwards. Not many ST/E games will. Im sure there is a list somewhere of tested ST/E games with backwards, but I cant remember where I saw it.

Smeg.

Well after a lot of surfing I found a util that will indeed turn it on and off! ;)

If anyone wants it, here it is:

http://files.dhs.nu/files_util/mem-test.zip

Thanks
Tim

Just yell at it-

"Your father was Jack Tramiel and your mother's name was Leonard..!"

"Your parents never really loved you, or else they would have marketed
you more successfully..!"

"They really wanted an Amiga, but got stuck with you..!"

That should be pretty degrading.

BobR

What I have found is that the 'route' program seems to be the cause of
the broken x-server display.

With 'route' in the correct place (/sbin) then the Sparemint scripts start the network but the X-server can't open 0:0.0 when a client is started.

If I restore my old script for starting the network and COPY 'route' to /usr/etc (that is where it was originally) then both my old script and the Sparemint scripts start the network but X doesn't work.

Lastly if I delete 'route' from /sbin so that the Sparemint scripts cannot fully start the network and only my old script works then X works perfectly.

I used the route and ifconfig commands to look at the network in both states and they appear identical.

I've also looked at all the scripts and they seem to do the same thing but the order of the ifconfig and route commands differs slightly.

Very wierd.

Regards,

Peter

Having used nothing but 1.44Mb floppy drives since the days of the Falcon030 has seriously affected my perspective on the functionality therewith.

You are, of course, correct. I was somehow assuming that a 1.44Mb floppy would be seen as MORE than a 720K floppy by an ST, but how could it? But you can't USE (read/format) a 1.44Mb floppy with an ST, can you? Don't recall if I ever tried.

But, in the scenario presented, what is this "covering up" of the second hole for? Making a 1.44Mb drive treat a 1.44Mb floppy as a 720K then? Why? If you needed to do that with a Falcon030 (or Atari clone), wouldn't that mean the drive isn't working as it ought?

I would like to transfer some data between my PC and Falcon030. I have a Zip100, Jaz 2GB, and EZ135 SCSI drives that I can use. Which ever is easiest.

How can I mount one of these drives on the Falcon and see the drive?

I tried using the EZ135 since it is a smaller drive and formatted it with FAT on PC, now I need to know how to have it mount on the Falcon.

I am using SCSI-Tools 6.10 on the Falcon and TOS 4.02

Thanks
Tim

Use HDDriver.
Use HDDriver to format media as PC media.

> I am using SCSI-Tools 6.10 on the Falcon and TOS 4.02

Old an not up to date.

Regards, Robert
(Using ZIP100 to transfer data from Mac to Falcon)
(Faster way is to connect the falcon with ethernet)

Yes, and you may use HDDriver's support for Bus Arbitration, which basically means
that both the
PC and Atari may be connected as terminators on each side of the SCSI chain. Thus,
you don't have
to disconnect the hard disks between each transfer as long as you don't read/write
at the same time.

By the way, I have used HDDriver with an EZ220 SCSI drive and it works fine.

I am using an EZ135 on my Falcon's SCSI bus and another on my son's PC connected via an Adaptec USBXchange USB -> SCSI adaptor (if your PC has a SCSI card, then that will not be needed), and move files between the computers this way. The important thing is to partition the carts PC-compatible. HDDRIVER will do this, but only for a single partition on the drive/cart. I don't know whether SCSI-Tools offers a similar facility. If not, change to HDDRIVER! With that driver, it is even possible to connect both the Falcon and PC to the same SCSI bus, so you may not need a drive as intermediate at all!

Sorry I am answering my own posting again but this is getting stranger.

Today the location of 'route' doesn't seem to matter but the location of 'ifconfig' does. X doesn't work if 'ifconfig' is in /sbin but it does work if it is in /usr/etc. This is with my old rc.net script running before the proper Sparemint one during boot-up.

My old script looks like this:

```
#!/bin/sh
ifconfig lo0 addr 127-0-0-1 up
ifconfig rtk0 addr 192-168-0-201 netmask 255-255-255-0 up
route add 192-168-0-0 rtk0
route add default rtk0 gw 192-168-0-1
#
```

I've replaced the dots with dashes so that they don't look like ip addresses.

The Sparemint script does things in a slightly different order but also adds a broadaddr and redirects the output somewhere else ??

```
#
ifconfig $intrfc addr $ipaddr netmask $netmask broadaddr $broadaddr up > /dev/null
2>&1
#
```

My config.if file looks like this:

```
#
lo0  127-0-0-1
rtk0 192-168-0-201 192-168-0-0 255-255-255-0 192-168-0-255
#
```

the last field is the broadaddr. Could this be the cause of the different behaviour ?

Regards,

Peter

SNIP

Thought i'd mention it though your mileage may vary - I use cubase audio falcon, and have a 1GB Jaz on the scsi bus being shared by the Falcon and PC. Now as long as its not the same file that you are read/writing, you can in fact read files simultaneosly by both machines, I have even tested it where I had cubase playing back several audio tracks while the PC was writing a large file at the same time, and everything checked out OK.

Smeg.

Heiko's Falcon Compatibility List is still posted at MyAtari.com.
Check out http://www.myatari.com/f_games.txt for ideas. Note however,
that the Falcon is not completely backwards compatible with the ST.
Having a 1 MB ST around for games is a good idea.

I just received a Falcon 030 w/14Mb ram and a 12Gb hd that I bought on
eBay.

I opened it up to verify the ram and hd, and discovered that it also
has an add-in board with an Siemans 80286-16 CPU on it.  The board
says Hansi & Susi and also (c) 1993 Sack Electronic Gmbh.  Does anyone
```

know what this is and where I can get the software for it, so should I simply remove and discard it?

My other question is: How do I connect this to a TV? I am working on making an adapter for a SVGA monitor, but in the mean time I really want to test this and the video output is an RCA Phone connector. Since he Falcon has a Hi/Low channel selector, how do I connect it to the TV? (I already tried a direct video connection but that did not work.)

Thanks to everyone for the assist.

That board sounds like it is a 286 PC emulator board but actually offers the hardware processor. It's useful to some but I have never found much use for them honestly.

That RCA style jack is an RF jack. You would hook that up to one of those boxes that is similar to what a Nintendo uses to hook up to the Coax jack on the back of the TV. You need one of those, most of them will work with the falcon enough to at least get some sort of picture on the screen, though you probably want to get something specific to ensure that you get a good picture.

Thanks,
Mark

>

If you want to connect it to the Composite inputs of a TV/Monitor simply connect pins 11 and 12 to a RCA plug. 11 goes to shielding and 12 to core. Easy to make.

I did this and was able to connect to my 27" TV.

But any TV RF box will allow you to connect to a TV as well. I had a few lying around from other Atari Computers. As a side note I tried a Nintendo one and the reception was really bad! Not sure why that was. I prefer the Composite better though.

I got mine recently off ebay as well. You paid slightly more that I did though!

Wow that is cool.  I guess I need to get HDDRIVER then!  I have been
stalling as I do not like mailing cash in the mail.  Especially $50.  Wish
someone would sell the latest version here in the USA...

   ^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^

I am agreeing with you there.  Well it seems the Falcon030 is quite the jump
from the 520ST.  Kind of reminds me of the jump from the Amiga 500 to the
Amiga 3000.  Same issues, over half the games did not work.  Though the
degraders were surprisingly effective in getting most games to work!  They
now have HD patchers that will make most games HD installable and run on
even the fastest Amigas with 68060's which is nice...
```

Well I have one 1040STf, one 1040STe and a 4160STe so I am covered with that one! LOL

You can use HDDRIVER in order to create a partition on one of these drives that is both PC and TOS compatible. Without any additional software, except for HDDRIVER, you can then use a cartridge for exchanging data. See also http://www.seimet.de/hddriver_english.html

Now as long as its not the same file that you are read/writing, you can in fact read files simultaneosly by both machines, I have even tested it where I had cubase playing back several audio tracks while the PC was writing a large file at the same time, and everything checked out OK.

Just to clarify this: This works fine for reading data from the same partition, but you may not write on a shared partition. This will lead to corrupt data as both the PC and the Atari have their *independent* caches for partition data. The PC will not notice if the Atari changes data on a partition and vice-versa. This is an issue which cannot be resolved by a hard disk driver.

I see someone already posted about a program to switch it back on, but just in case you're interested, here is the official way to fix it. :)

You can use nvconf (or something like that), which configures the settings in the Falcon's nvram. At first sight, there doesn't appear to be a setting for the memory test. But it's hidden in the startup-delay setting; if the delay is lower than 8 seconds (IIRC), the memory test is skipped.

Maurits.

Yes and no. HDDRIVER supports the SCSI driver's target interface, which means that TT and Falcon can act as SCSI processor devices and receive SCSI commands from other computers connected to the same SCSI bus. They can receive commands and send back results this way, just like a hard disk drive does. This can be used to implement a SCSI-based network, for example.

Thanks, I'll try the cable. Actually, I don't mind the price, as it
included Cubase Audio with manuals and dongle. The seller also threw
in a 200Mb drive that was in the system when he bought it, as he had
upgraded it to the 12Gb drive.

Larry

Ok so with HDDriver this is all that is needed for accessing a 135MB FAT
partiton? (or 95MB for Zip, 1024MB JAZ)??

Or do I need BigDos or something? (Which I am unable to use as it makes my
left mouse button stop working when I run it!)

This is getting to be a real pain....

Damn why is it so hard to access PC HD's on Atari when it is supposed to be
native. Wasn't this hard on Amiga...

Tim

Good idea but it didn't work.

I have been comparing the old script with the new one and typing each command at the Bash prompt. I noticed this difference:

```
NEW > ifconfig lo0 addr 127.0.0.1 netmask broadaddr up > /dev/null 2>&1

OLD > ifconfig lo0 addr 127.0.0.1 up > /dev/null 2>&1
```

Because there is no Netmask or broadaddr that can be substituted in the NEW script I left them blank. When I enter the line from the OLD script then JPilot will not start but when I enter the OLD command it will start ok most of the time.

Are there any dummy values that I can put in /etc/sysconfig/config.if ?

I have just spotted the difference in the network settings...
When Jpilot is working ifconfig reports:

```
lo0:    flags=0x4b<UP,BROADCAST,LOOPBACK,RUNNING>
        inet 127.0.0.1 netmask 255.0.0.0 broadcast 127.255.255.255
```

but when I have run the NEW version it says:

```
lo0:    flags=0x4b<UP,BROADCAST,LOOPBACK,RUNNING>
        inet 127.0.0.1 netmask 255.255.255.255 broadcast 127.255.255.255
```

I enter the OLD line again and it changes to this but Jpilot does not run:

```
lo0:    flags=0x4b<UP,BROADCAST,LOOPBACK,RUNNING>
        inet 127.0.0.1 netmask 255.255.255.255 broadcast 127.0.0.1
```

If I enter it a second time then Jpilot works:

```
lo0:    flags=0x4b<UP,BROADCAST,LOOPBACK,RUNNING>
        inet 127.0.0.1 netmask 255.0.0.0 broadcast 127.255.255.255
```

You are probably as confused as I am by now.

Regards,

Peter

> partiton? (or 95MB for Zip, 1024MB JAZ)??

This is correct. Note that only a single partition per cartridge is possible. This partition may be as big as supported by your version of TOS, i.e. 1024 MB on a Falcon, 512 MB on a TT etc.

> Or do I need BigDos or something? (Which I am unable to use as it makes my
> left mouse button stop working when I run it!)

No, as I already mentioned you don't need any other software than HDDRIVER.

> Damn why is it so hard to access PC HD's on Atari when it is supposed to be
> native. Wasn't this hard on Amiga...

I don't think it is hard. You just have to use the right software :-).

I see your problem. You configure lo0, this is not neccessary anymore (at least not under Easymint and there is no such line in an Easymint script; provided you use the uptodate kernel and xdd/xfs normally installed by Easymint).

Btw. correct netmask is 255.255.255.0 and correct broadaddr is 127.0.0.255.

As already suggested here, install Easymint completly new on a different partition. This is exactly why Easymint exist: easily installing a correctly FreeMiNT and network setup.

Tschuess
...Frank

It's not. I've used HDDriver on my Falcon from day one and I never had any
problems
at all with my hard disks. I shared data between my Falcon, PC and Akai sampler
without
any problems at all.
```

That's very interesting.

Has anyone made such a network?

Derryck Croker wrote:

> Has anyone made such a network?

No, nobody has ever showed any interest in using this interface. What I have done, however, is testing it by implementing a new SCSI command that a TT/Falcon can send to another TT/Falcon and that returns memory contents. The sources for this sample application are available, but one must be a SCSI expert to have any use for them.

Hi!

"Tim" <tjlazer@mail.com> a �crit dans le message de
news:vd35aaqbjhvh8c@corp.supernews.com...
> If you want to connect it to the Composite inputs of a TV/Monitor simply
> connect pins 11 and 12 to a RCA plug. 11 goes to shielding and 12 to
core.
> Easy to make.

RF modulation is now obsolete since most of the devices you could wish to
connect to the Falcon have composite inputs.

I for myself cut off the power supply of the RF modulator and made a bridge
with a 82 ohms resistance from the motorola composite output to the RCA
inner connector, so that I can easily connect any TV/VCR directly to the
Falcon with their original RCA cables.

> I got mine recently off ebay as well. You paid slightly more that I did

So is this check for lo0 in the rc.net script needed anymore ?

```
        if [ "X$intrfc" != Xlo0 ]; then
                route add $network $intrfc
        fi
```

>Btw. correct netmask is 255.255.255.0 and correct broadaddr is

I have just removed the lo0 line from config.if

>As already suggested here, install Easymint completly new on a different
>partition. This is exactly why Easymint exist: easily installing a
>correctly FreeMiNT and network setup.

I did that yesterday but again lots of things didn't work properly afterwards.
It had wrecked my AUTO folder and tried to make all my partitions NEWFATFS.

NEWFATFS=A,B,C,D,E,F,G,H,I,J,K,L,M,N,O,P,Q,R,S,T,V,W,X,Y,Z

The D and E partitions are 500Mb, TOS but don't work with NEWFATFS and I get
lots of errors. It doesn't copy any of the stuff from the existing MINT folder
like SLB's.

Things are working again now. Thanks for the help.

Peter

I really do not know what is happening, but all I know is that I
cannot format a 1.44meg floppy in my STe unless I cover up that
second hole. I can see your point however...

>Luposian

YOu are correct. On my Hades it does not matter since it has a
1.44meg floppy drive in it. It is my STe and my ST I am talking
about. Covering up that second hold makes formatting and the use
of the floppy alot easier. Sure you can use without covering it
up, but you will get alot of read errors and such.

Whatever. If I mistook your reply. I apologize. All I know is that
what happens in my case. However, I have run across many people
who have had experiences with their Atari's that I had never had.
Maybe this is such an experience. take care...

Maybe you have a 1.44 capable drive in the STe but used only as 720?

I don't now how the drive determine how much power should go to the write
head but mayby the drive checks the hole regardless what format commands
it gets. Sounds stupid, but some computer designs are...

Nevertheless it's a good idea anyway to cover the 1.44 hole. You never

know what sort of computer the disk will be put in in the future.

Actually, it wouldn't be that stupid. The write head signal strength that should be used, depends on the material of the disk, not the used format. So even when formatting a HD disk as DD, it should still receive the HD-type signal.

The fact that DD-drives can't do this, is the reason why HD disks in DD
drives can be unreliable.

But that would mean that you wouldn't get any problems if you left the
hole open.

Maurits.

That sound like a good idea, but I don't think I want to modify mine like
that.. Want to keep it stock.

Well I DID see the price he paid, as I was looking at the auction unfold. I
paid $350 for mine, but it only had 4MB and 60MB HD. It seems that he got
the better deal, but I didn't need all the extras and this was exactly what
I was looking for. :)

Frank,

How does init know which aes to start ?

I have been trying to have a play with Xaaes but every time I reboot
N_AES is started.

I changed all the paths in Mint.cnf, I changed C:\MINT\AESPATH but I
still get N_AES.

I even tried renaming the N_AES folder so that init could not find it but
init went into a loop saying "file not found" or something like that.

Regards,

Peter

I used HDDriver and can confirm that it worked fine. It even supported bus arbitration (two active devices accessing the same hard disk) and it worked fine. I had the Falcon at one end of the SCSI chain and an Akai sampler at the other end and both were accessing the same hard disk and CD-ROM (not at the same time though) in between these two.

I have an atari Mega 2ST that was missing the keyboard. I hacked the keyboard from a dead Atari 1040ST onto it and it's workable, except that now I have the keyboard sitting on the desk with no case for it. Every now and then the keyboard (and joystick ports) go dead (and you get the repeated bell sound from the ST speaker). When this happens I can usually fix it by pressing down on the large socketed IC on the bottom of the keyboard. Sometimes I have to reboot.

Is there anyway I can use a PC keyboard on my Mega2ST? I know there's a patch to let me use a PC keyboard plugged into the MIDI port, but the only thing I use my Mega2ST for is MIDI. It wouldn't do me much good to lose my MIDI in port.

Are there any points on the ST keyboard where I could splice in a PC keyboard then I could turn the ST keyboard upside down to keep that chip from working itself out as well as maintain the use of the joystick ports. I can put the ST keyboard in a safe place and use the PC keyboard for typing.

I know there used to be a company that made a little box you could plug a PC keyboard into and still have the joystick ports as well, but they don't seem to be in business anymore.

Does anyone have the schematics for the MIDI B serial port interface that worked with Master Tracks Pro? I assume the additional MIDI interface for MTP used the serial interface.

Hmmm, Coma wasn't that fax shareware? I think I bought it in the mid 90s.

But these are _fax_ programs. You can still get Coma from
http://home.t-online.de/home/SiggiH/CoMa_Atari_en.html but not for free
:-)

It should perfectly possible and too hard either to have a Falcon as a
voice answering machine. It has line in/out so all you would need is a
standard modem and some simple extra electronics.

There were also rumours about an all _software modem_ for Falcon using
the DSP. I guess that is what was mentioned in the Falcon brochure.

I saw a hardware/software device on eBay awhile back for use as an answering
machine with a Falcon. I wish I could remember the name of
it. I thought about bidding, but there is no way that I could tie up my Falcon
for that purpose. I use it for everything (midi/hd
recording, publishing, web, mail, news, etc.). I could make use of the Falcon in
question too, if you ever choose to turn loose of it
:-).

have a look at free keys, it is an external case for an ST keyboard. I have a couple, and the work fine.
http://www.atari-workshop.co.uk/products/desk_topper.htm As far as the sockets go, you may have to resolder the 9pin plugs, and the cable on the keyboard itself. The joints sound a little dry. Another solution is this
http://www.atari-workshop.co.uk/products/keyboard_accessories.htm or this
http://perso.wanadoo.fr/laurent.favard/eiffel_e.html

Yikes! 49 pounds for the keyboard adaptor from Atari Workshop. That's pretty steep. That's something like over $100 canadian.

The eiffel one I don't quite understand. Do they sell that or is it something you're supposed to build yourself. The english of the page confusing very is.

Damn. I was really hoping there would be a much simpler solution.

That's right Kent. I actually own Coma and there was probably an all software modem
described in that flashy blue brouschure (vaporware). I think I still have the brouchure
in a binder somewhere.

Eiffel is a diy job, but it looks pretty sexy. I have just ordered 5 pics to
build one or two for myself, Laurent Favard and Didier Mequignon are
absolutely brilliant. This is the sort of thing that keeps me interested,
nothing like a hack.

Mark

why waste it, since you don't appreciate it, put it on EBay and let someone
buy it. Someone that's always wanted one. IE, ME!

It'd never get used, just collected, like the rest of my Atari stuff.

I am posting this again because I think the post was lost before I sent it.

Reading this article;

http://www.atari-users.net/modules.php?op=modload&name=News&file=article&sid=891

it seems that the 8-bitters will get a working USB implementation before
we do.

Also reading the recent discussion on printers it is becoming more apparent
that there is a dwindling supply of devices with traditional interfaces.
Just look at how many devices are now either only available in USB form or
are much cheaper and more common in USB form. eg. keyboards, mice, webcams,
digital cameras, PDAs, modems, scanners, printers, CD and DVD drives, card
readers and no doubt many more that I am not aware of.

Could the source code for this 8-bit driver be used to create a driver
for the ST(e)/Falcon/Hades/Milan etc. ?

Regards,

Peter

> absolutely brilliant. This is the sort of thing that keeps me interested,
> nothing like a hack.

Eiffel is good. I built one, though some problems with the design from what I saw. The PCB design on the website has the wrong pitch of socket for the PIC, well my PIC I ordered didn't fit.

Also, if you build yourself use a crystal and the two capacitors. I started off using a resonator, which didn't seem to work at all, though I've used these before.

Please note, this is if you construct it yourself, I would imagine one bought would be fine! It all works really well, no software is really needed for simple keyboard use.

The latest version of firmware has extra features that the current design doesn't support, like two atari joystick ports. I have a redesigned board sat on my Falcon (scooter design). I have to check spacings between components and double check everything. It also has a JTAG header for ISP programming. I have emailed Laurent various times, he never answers me.

I have a PC and a Falcon connected together this way, sharing a 1gb Jaz
drive. They seem to be able to read and write simultaneously, but I dont
wanna put this to an extreme test.

Smeg.

How do you connect two computers on a scsi bus like that??!?!? Just like
you would two scsi devices? Hmm might be a good idea as I have a bunch of
scsi crap between Amigas, and PC's....

Time, you just connect the other computer at the end of the chain, instead of
terminating the last device.

You know, a series of SCSI devices on the bus is a *chain*. You have one computer connected to A, which connects with B etc. and the last one should be terminated (have a small blob connected which marks the end of the chain). But instead of terminating, you just connect yet another computer (or sampler as in my case). It works as a terminator, but it is also an active device, which might take control of
the bus.

In my case I had a configuration like this:

Falcon --- Hard disk --- CD-ROM --- Akai sampler

The Akai is basically a computer so one could have a computer there instead. I had (well have) sampling CDs for the Akai, which I could access on the Akai and I could also use the same CD-ROM drive for the Falcon. For a while I used a SyQuest drive with removable 220 MB cartridges instead of the above hard disk. Then I sometimes stored samples in Akai format on a couple cartridges and had another cartridge, which was Atari formatted, and stored programs on it. Quite neat.

However, don't let the two computers access the bus exactly at the same time. But they can indeed be switched on at the same time though. The documentation to HDDriver confirms that bus arbitration is supported. However, I think there were some limitations, for example that you should avoid accessing the bus at the same time etc. but I'm not sure, so look it up in the manual. The above configuration worked for me.

Kind regards

Free Unknown Condition Atari ST Stuff:
======================================

1 Navarone Atari ST cartridge port->SCSI(?) scanner adaptor
1 dead Atari 520 STfm (parts?)

Free Working Atari ST STuff (used a few months ago):
==

1 Atari SM125 mono monitor
1 Atari SC1435? colour monitor (Goldstar?) - starts to flicker when it gets hot
1 Atari Mega ST 2, upgraded to 4 megs - no power supply, but has hacked connector to connect to PC power supply (I have a PC case + power supply for free too - grab that, and you're good to go!)
1 Atari SF-314 case + circuit board to plug into regular 1.44 floppy + power supply + floppy connector cable (actual drive is in a 1040stfm)

1 Atari STe-1 motherboard. Includes 4x256k ram Simms, no floppy controller chip. Has standard PC power supply connector, booted off hd when I tested it several years ago.

Free Atari ST books/software
============================

Metacomco Pascal
Laser C (w/ source code debugger, etc)
GFA Basic 3.0, GFA Vector, etc
DevPac ST (later version)
various other original titles (Flash, Shadow the background transfer program, QuickST, Sudden View, some games, etc)

GEM Programmer's Reference
ST Internals

Everything is free if you pick it up in Kitchener-Waterloo. Otherwise, whatever it costs to ship.

Reply to this email address.

It would be nice to use such devices. As for the source, it's probably
assembler since a standard 8-bit has tight memory restrictions.
However that doesn't mean it's impossible. ;-)

That should be fairly simple. The problem is accessing the device from
hardware. What port on a bog standard atari ST would you use such a device?
(DMA ?). On the Falcon however I think its technically possible to use the
DSP port, and then use the actual DSP to handle the data handling. This
would leave non falcon owners out in the cold though.

Smeg.

At some point you have to leave someone out in the cold. A plain
jane st is rather limiting, I think 030 machines should be the minimum
these days but I'm sure that is not a popular opinion. Anyway if it could
be done on the DSP port that would be fine so long as it was open source.
The clones have PCI slots so if someone came up with a solution and it was
open source it could probably be adapted/ported.

Unfortunatley I have not yet had time to read the article(s) mentioned above so appologises if I covering something that was mentioned therein.

Yes, we will eventually have to create a USB adaptor of some kind if we want to be able keep running even basic things like printers things although the downside of this will be a loss of speed.

The whole point of changing from Serial to Parallel in the first place was an increase in speed, afterall if you can send 16 bits at a time instead of individually you get a minimum 16 fold speed increase.

Unfortunately with PC processors becomming ever faster and more power full while at the same time being less and less utalised (how much processor time does a word processor need) with the excpeption of playing games there is plenty of spare processor capacity for PC's to be able to run serial communication fast enough that most there is a negligable time delay for the end user.

On older and slower machines like the ST and even the Falcon reverting back to serial will produce a noticable time increase in data transfere. As for which ports to use the existing serial port would seem like an obvious place to start as we will be using serial anyway.

Another solution would be to use the Parallel port and have a serial-Parallel/Parallel-Serial converter connected to it, a PIC Microcontroller would seem like an ideal device to use as it can store and run its own interface program, talk to the Atari in parallel and the USB in serial and thay can run a 20Mhz so Serial comminication withthe USB device will probably be faster than that with the printer port.

However at the moment all Microcontrollers I am aware of are 8 bit and so while this method may be possible in an 8 bit machine I believe the Parallel printer port on the ST/TT and Falcon is 16 bit and so we will have to wait and see if/when 16 bit microcontrollers become available before we can take this approach.

There are lots of PCI USB cards available, so you can start right away with the drivers. When you have these working, you can think about building hardware for the other machines.

At first one should try to create a standard software interface for USB access (like the fine PCI_BIOS) that allows hotplugging of USB devices.

Then there has to be some low-level driver to access some PCI-USB-cards (easiest way if one can get hands on a cards specs) or for some hand made solutions for standard Ataris (ROM-Port or DMA or serial or whatever makes sense).

And then the most necessary step: make drivers for USB devices (printers for the first, scanners, and all the rest). Otherwise there will be a new port that cannot be used at all.

I have to admit that I have no idea if accessing USB devices is much similar to accessing devices on the serial port, but I remember to have read that the first USB printers used the old serial interface commands, just transfered over USB now.

Alexander

Not really. First, the printer port is ony 8 Bits wide, and most printers
are limited to about 100-200KB/s data rate on the parallel port.

Now standard USB 1.1 has a raw data rate of 12MBit/s, which yields more than
1MByte/s real transfer rate, so I don't see where you would get a slowdown
from hanging a printer on a USB instead of a parallel port.

Even considering EPP parallel ports (which only the Milan has), getting more
than about 1MByte/s is difficult, so USB comes out fine in terms of speed.

No. I think you missed the change from parallel to high-speed serial
interconnects. And since the USB host adapter handles the data transfers by
DMA, the CPU does not have to do much work - less than on a parallel port
which is not DMA-driven except when using ECP on a PC.

If you start with a PCI USB card, you can use lots of code from the Linux
USB implementation.

Xref: archiver1.google.com comp.sys.atari.st.tech:4513

I can no longer find discs any smaller than 1.44 meg locally. Is there a source
from which I could get a quantity of double sided double density that will work
in the 1040ST? I think they are 720 kb.?
Also, is there some way to get the Atari to utilize the 1.44 meg discs?
Thank you,

Garth~

Starting with a PCI USB card is probably the simplest way of getting the
idea off the ground. The only drawback is that it does limit the pool of
potential developers.

Does it matter which USB card is used ? Perhaps someone could suggest one
that should be used, standardising on one card might make things easier.

Although getting a USB printer working would be very nice it also perhaps
the most difficult to achieve. It is probably more sensible to start with
something simpler while the low level routines are developed. Even if
getting a USB mouse working does not seem very exciting it will open the
doors to other devices. This might generate more interest.

All IMHO.

Regards,

Peter

I have no idea, but maybe there is some kind of hardware standard as well
- who knows ;-)

PS> Although getting a USB printer working would be very nice it also perhaps

Yes, or think of an USB memory card reader. Then a "no noise hard disc
drive" could get much more affordable (IDE or SCSI memory card readers are
really expensive and hard to get hands on).

Regards,

Alexander

Given the potential for saving money on cheaper peripherals it might
mean people will actually buy the driver software !

What we need is some input from someone with experience of writing or
porting device drivers.

Regards,

Peter

I think if you cover up the extra hole with some tape, they should work just fine..

If I thought for a moment it was do-able in GFA-Basic I would.
Sadly that is the language I know best. ;-)

I don't know. However, the USB protocol is well known, and USB -> whatever adapters are pretty common. What's needed is to reverse the adapter and make a whatever -> USB. Since the USB 1.1 protocol is just a serial bus (that even includes a 1.5 megabit subchannel) it could definitely be done. Device (printer, webcam, etc.) drivers are quite another issue.

will work in the 1040ST? I think they are 720 kb.?

Sure. Viking Direct (among others) will sell you DD floppies from two manufacturers. They are still being made.

> Also, is there some way to get the Atari to utilize the 1.44 meg discs?

Yes, but it's costly. You have to upgrade the floppy chip in your computer, switch to TOS 2.06, and add a 1.44 Mb mechanism. Upgrades were available for sale, but I haven't seen them recently.

Using 1.44 Mb disks as 720 Kb disks often works, but is unreliable. It's sort of like using a sharp screwdriver as a chisel -- yes, it works, but eventually you'll damage something.

*Not* so...the 1.44 meg disks have a different coating that
requires different recording heads to record. The 1.44 disks
will *never* be reliable when used with 720k drives.

Interesting.. I've used 720K floppies as 1.44's (back in the day) by putting
a hole in the case, and vice versa.

I didn't expect them to be totally reliable, but I guess it depends how long
you need 'em for..

I find the 720s get unreliable after a few years of sitting on the shelf
```

anyway, so I never worried about it much..

Actually, I'd rather have the PC Keyboard/mouse adaptor because should the new keyboard die it is much cheaper and easier to get another PC keyboard than it is to get another MegaST keyboard.

Thanks anyways though.

>that should be used, standardising on one card might make things easier.

It doesn't matter AFAIK, so long as the card follows a certain protocol.
That means that you can use the same card in a PC and a Mac with no
problem. I believe the same extends to Firewire.

Cheers

Derryck

I am now seeing this as a two part problem:

1: generic USB driver software
2: USB adapter for Ataris without PCI

Hardware developers able to produce a means of connecting a USB device to a Falcon/TT/ST are a precious commodity and developing the hardware could take a long time. Meanwhile, a PCI USB card can be plugged straight into a clone.

If the Linux/NetBSD drivers can be ported to Mint (and perhaps Magic) then this would provide the basis and insentive to produce a non-clone adapter.

Do we have any Mint developers reading this ?

Regards,

Peter

Hi all,

In my Mint.cnf I have a path set to:

```
  setenv PATH .;C:\n_aes;C:\n_aes\apps;c:\mint;/bin;/usr/ucb;
  /usr/etc;/usr/bin;/usr/sbin;/sbin;/boot/mint/bin;/usr/local/bin;/m_tos
```

but when I open a shell prompt and enter the command 'env' it shows the path as:

```
  PATH=/bin:/sbin:/usr/ucb:/usr/etc
```

This doesn't make sense to me. Is there anything else that could be setting a different PATH ?

Peter

Well, I for one have just bought my first bunch of STs. I always fancied one
when I was younger but could never afford one. By the time I could afford
one, they had stopped making them!
Now I can pick them up on Ebay for about �10 which is amazing value. Ok they
are not as fast as a modern PC, I have a P4 2.6Ghz with a gig of ram and
160Gb of hard disk, no small machine.
Why am I collecting STs then when I could run an emulator on my fast PC?
Well I guess thee is the nostalgia thing, but I am also determined to use
the thing to do something useful, as a controller or something.
I have been gigen an ST Mega 2, which I will use in my recording studio,
along side the old FM synths whose only method of editing is via ST
software.
I am collecting Amiga hardware too, for the same purpose.
It's a nostalgia thing.

I'm soon to 'inherit' an atari ST (FM I think).
I'd like to add a hard drive to this. I know the Sh205 *used* to be
available...

Anyhow, is there any way I could build an interface to connect a SCSI drive
to the atari DMA port? Or elsewhere on the ST?

Regards,

Bob

Sure, the shell system configration file normally overwrite the existing
$PATH (for bash the system configuration is under /etc/profile).

Looking at the Linux drivers, there are only 3 types of USB host adapters - all cards I know are compatible to one of these and can use the same driver under Linux:

- UHCI (Intel, VIA ...)
- OHCI (Compaq/Microsoft/National)
- EHCI (USB 2.0)

>something simpler while the low level routines are developed. Even if

Yes. Input devices have the advantage that there is a standardized command set.

Additionally changes to $PATH can be done in n_aes.cnf (or in XaAES's
equivalent).

I would get a Link II SCSI host adapter and add on an exteranl
SCSI hard drive. That is what I did with my 1040STe.

You can actually use the 1.44mb disks on a ST. Just cover the hold
in the upper left corner with something like electrical tape
before you use it.

... or sell the ST and get a used Falcon. That might actually be cheaper
if the built-in HD has enough space for what you intend to do.

I don't think that you can build an ASCI-to-SCSI-Interface, because it's
a very complicated job. But you can buy one; I think at least three
different firms had adapters available to connect a SCSI-drive to the
ACSI/DMA port.

Bye,
    Fritz

I've managed to get myself a stacy from ebay,though I don't know it's basic spec.

Is upgrading the memory a chore, does anyone know what type of memory it takes.
Also, if it doesnt have a hard drive, can I add one, and if so, what type do I need.

Thanks for any advice...   Rob

Actually does the hole really need to be covered on the ST? I have not

tried on the ST but I know on the Amiga I can just format a 1.44 as a 880K
(DSDD) disk without covering the hole.

We may have been reading the same article. That seems to be the order
that these standards were created. The later OHCI and EHCI sound like
they are better and require less work from the host computer.

Is that just keyboard, mouse, trackball, artpad type devices that don't
receive any data or commands ?

Thanks guys. I had check the n_aes.cnf and that wasn't setting the path
but it does seem to be altered by the etc/profile file which as this in it:

```
# Path manipulation
if [ `id -u` = 0 ] && ! echo $PATH | /bin/grep -q "/sbin" ; then
    PATH=/sbin:$PATH
fi

if [ `id -u` = 0 ] && ! echo $PATH | /bin/grep -q "/usr/sbin" ; then
    PATH=/usr/sbin:$PATH
fi

if ! echo $PATH | /bin/grep -q "/usr/X11R6/bin" ; then
    PATH="$PATH:/usr/X11R6/bin"
fi
```

Shoudldn't the path include a few more things?

Next question. Why is the path set in mint.cnf if it is then changed by
the profile ?

Regards,

Peter

the drives in ST's that ive pulled apart don't have the microswitches
soldered on the board under that side of the disk anyway, I fail to see any
reason to cover the hole.

I want to install a 4GB or 8GB Laptop HD, can I do this and what HD software
can I use other than HDDRIVER? I am in the USA and not sure on how to get a
copy of it, but do have AHDI 6.

Thanks
Tim

No problem. Only when you would use a HD with more than 8GB you need
HDDRIVER to use the part above 8GB.

Drives with less than 8 GB might still work with AHDI.
As far as HDDRIVER is concerned you can order a copy with an English
manual from Atari Workshop in the UK. Or, if you can read German you can
also order it directly from me.

Hi, Peter!

PS> Thanks guys. I had check the n_aes.cnf and that wasn't setting the path
PS> but it does seem to be altered by the etc/profile file which as this in it:

These lines extend PATH, it must be reduced somewhere else...

PS> Shoudldn't the path include a few more things?

Yes, but they are assumed to have been set before.

PS> Next question. Why is the path set in mint.cnf if it is then changed
PS> by the profile ?

Cause in mint.cnf it's not clear wether one will log in as root or as a user. The user should not have sbin-directories in his path, as he anyway has not the rights to execute them...

Regards,

Alexander

I'm not much of a MiNT developer, but yes, I'm reading it :-) I've been wanting to attempt USB drivers for some time, but dont have docs or a PCI card to test with. Add to that I dont know how USB driver software is built up. But it would be real fun trying :)

Without going into debate whether $40 is too much, I would like to add that
a MegaST (not MegaSTe) keyboard is likely to outlive any other piece of
computer equipment you might have- they were very solidly built, had the
entrails made by a reputed company (Cherry), with real switches and in a
very good casing- e.g the keyboard weights about 1.8kg.

That I can understand, as if the PC has a HD 1.44 Drive it will see it as a
unrecognized 1.44 disk and want to format it. Covering the hole will let
the drive see it as a 720k one.

Greets all.

To those following my recent posts re 68010 CPU into an ST, the hardware
hackery is progressing well.

We now have the 68010 CPU running in the 1040STFM, by using TOS2.06 (1.0x
doen't work). It boots, runs virtually all programs, HOWEVER all versions of
gembench I have (3.03, 3.1x, 4.04, etc) crash on the floating point test -
the machine just locks up with no mouse pointer; (no bombs are displayed).
This seems to be a common complaint with gembench - archived news posts on
google point to early gembench versions doing similar things on falcons. I
believe there's a specific library file required; autofpu.prg or something

similar. Does anyone have/know about such a thing, for a 68010 environment???

I also need something to go in the auto folder to set the cookie for 1.44 floppy disk recognition; I have patched the 8/16MHz clock to the WD FDC chip using one of the commonly available mods available from the web and can properly read 1.44 and 720 disks, but can't format HD disks on the ST, since the option is missing on the format screen because of no cookie.

For those of you with any curiosity, the next hacks to be done will be for overscan, bootable IDE HDD, stereo sound-out, PS/2 keyboard and mouse, and possibly 4Mb RAM upgrade. Pics coming soon - stay tuned! Our goal: the most modified ST ever; why? because we can :)

Craig

Okay, this is getting silly. Covering the hole on a 1.44mb disk so you can use it in a 720K drive is pointless.

A 720k disk drive has no mechanism to detect wether the disk inside it is 1.44mb or 720K. Only 1.44mb disk drives have a mechanism to determine if the disk inside it is 720K or 1.44mb. If your drive has a 1.44mb drive inside it then why put a piece of tape overtop of the hole in order to format the 1.44mb disk in an unrealiable format it wasn't designed to work with. Format it as a 1.44mb disk.

As for older 720k drives, you can order 720k blank disks from Grand and Toy office supplies. Hell you can order old 8" 128K floppies from Grand and Toy if you really need them.

If you order them, order them in bulk.

Have you tried Kronos ? I realise it will give different results to GEMBench
but it will avoid the problem completely.

Hi Mattias!

No - there is no point in covering up the hole as the Atari 1040ST
floppy drive has no sensor for HDs.

The answer to the original is that a 1.44 MB disk may work, but is
not reliable. The magnetic coating is different, needing a
different write current.

It is possible to fit an HD floppy to the machine, but it needs a
small hardware interface to raise the clock speed from the controller.
No idea where you can get it from :-(

Regards, /Peter/

I wonder whether it might be possible to use the SCSI port? I
have a (rather expensive) USB -> SCSI Adaptec USBXchange device on
my son's PC to allow me to use a SCSI EZ-135 on a machine that has
no room for a SCSI card. But note that USB ports are supposed to
provide power as well.

Provided that you have the proper floppy chip in your Atari (02-02,
if I remember correctly), you can make your own HD interface with a toggle
switch, some wire, and reasonable soldering skills.

OR you can get hold of a SCSI Floptical, which can format and use 720K
and 1.4M in addition to the 20M Floptical disks.

If anyone is interested in the HD mod, I can dig around and see if I still
have the write-up.

You are correct. I was thinking of what was necessary to allow me to move
files from PC -> ST...

>The answer to the original is that a 1.44 MB disk may work, but is
>not reliable. The magnetic coating is different, needing a
>different write current.

I've also used original IBM 720K disks formatted to 1.44 MB. Seemed ok.
Didn't use them for any important data :-)

Mattias

There is a good reason why this is expensive. That is a complete SCSI
interface with a serial converter in it. Remember the similarily expensive
parallel port to scsi adapters that you used to get with external CDRom
read/writers?

Personally I think a Cartridge port USB interface is probably the way to go.

1. Complete USB hardware solutions are available on a little prefab card
cheaply.
2. Every 16/32 Atari has a cart port.

Smeg.

Hi...

Thanks for your suggestion, however I have it on good authority that Kronos
needs 2.5Mb of RAM (and maybe a HDD?) to run...!!!

This is a 1040STfm... 1Mb RAM, 1.44FDD, no HDD.

    Craig

You must differentiate between USB hosts (this is what we need) and USB devices (this is what you have: your SCSI adapter, mice, keyboards, scanner). A USB device chip is usually unable to work as a USB host.

SCSI is a bad choice for two reasons:
- implementing SCSI target hardware requires quite a bit of dedicated hardware and protocol software

- USB devices want to be able to generate interrupts on the host (ie. the Atari), which SCSI (at least on a ST/TT) can not easily provide. Polling for pending interrupts will increase latency (ie. jumpy mouse etc.), and will create lots of CPU load.

The ISP1161 has both on one 64pin chip.

I reckon that Falcon owners could have an implementation using the SCI port
on the DSP chip. My info tells me its capable of 2.5mb/s which is certainly
quick enough for low speed devices.

Smeg.

New Falcon030 owner here! ;)

I have a Falcon030 with 4MB and TOS 4.02. Also installed a 128MB Seagate
drive to replace the old 60MB Conner. I would like to add a yet larger
drive but am having trouble autobooting from them. (See my other post)

Regarding Patches. What issues do I need to be aware of and what patches

are there that I would use to make it more stable? I hear this TOS is
buggy!

Also what is FPatch? It was on my HD but causes the startup sound to garble
when autobooting.

Thanks
Tim

Right. However, it looks like you still need either lots of glue logic or a
microcontroller to interface this to a serial interface (like the DSP port)
or SCSI.

>I reckon that Falcon owners could have an implementation using the SCI port
>on the DSP chip. My info tells me its capable of 2.5mb/s which is certainly

Quick enough, but getting good interrupt latencies might still prove
difficult - AFAIK, the SCI port does not have a dedicated interrupt input.

What would be the purpose of this hack? 68010 is supposed to be virtual-memory
capable, but I am not sure that this capability could be utilized on a ST.
AFAIK 68010 is also supposed to perform some operations marginally faster;
I am not sure if it is worth the trouble. Do you have any comparison
results yet?

With Gembench there should be two floating-point-related files and one of
them should be (re)named to AUTOFPU.BIN; one of the files (the larger one,
about 14KB) is for testing a machine with a real FPU (or no fpu?), the other
one (about 9KB) offers some kind of faking for cases where some weird
FPU-board design does not work properly. Using the "fake" one results in
some meaningless times computed, even with a standard MC68k.

I don't know, however, is this in any way related to 68000/68010 problem.

>I also need something to go in the auto folder to set the cookie for 1.44

>the option is missing on the format screen because of no cookie.

TOS 2.06 can set HD-floppy cookie itself (mine does, on a MegaST), but I think that the TOS image has to be patched. TOSPatch utility can do that, IIRC I did it before burning EPROMs a year ago, and as you probably burned EPROMs to run your machine it with TOS2.06, you can do it as well.

>For those of you with any curiosity, the next hacks to be done will be for
>overscan, bootable IDE HDD, stereo sound-out, PS/2 keyboard and mouse, and
>possibly 4Mb RAM upgrade. Pics coming soon - stay tuned! Our goal: the most
>modified ST ever; why? because we can :)

You could add to the list a serial port acclerator, a memory-mapped FPU (not very usable, because few applications can utilize it, but not difficult to do either- in my board the FPU and four 74HCT** chips hook on the CPU bus), an 8MB or 12MB Alt-RAM upgrade (VERY useful, and can be done with about 9-10 standard TTL chips and one 72-pin SIMM), and the acceleration of complete machine to 10 or 12MHz (with this last modification and some more hacking you could even get an increased screen resolution, up to about 800x500).

And after all those mods, you will most probably need a stronger power-supply, (FPU and RAM upgrades are rather power-hungry) because the one in a 1040ST will surely die :)

Hi....

I'm new to Atari Falcons (and STs for that matter) and am wondering if there is a guide anywhere (I can't find one) that explains how to get things going (hard drive configuration, booting from floppy etc). I've even read my manual that says there is a control panel but I can't find that anywhere either.....

Any help appreciated

Thanks

DM

Probably when the hole is *not* covered, witches and demons
enter the disk drive through the hole and impede the recording
and reading of data...   ;-)

(Oh, okay, you have a *better* explanation???)

I know that the Atari ST crowd is a clever bunch. So
has anyone developed detailed plans for converting
a 520 ST to boot from TOS ROM's??? I have a 520 and
would like to be able to boot it from ROM's.

Greetings,

I know that this should be a complete no-brainer, but I have tried about 5 different 1.44meg floppy drives in my TT and MegaSTE (the TT floppy failed) and I can't find any that will work. I've swapped the cables, swapped the power supply, and taken the working floppy and cable back and forth from machine to machine. No matter what I try, I can't get the other 1.44meg replacement drives to work in either machine at all.

Are there different types of floppy drives? I previously replaced the drive in my MSTE without incident, so has something changed since then?

Heeeeeellllllp!

Thanks :)

What is it doing? are you sure the data cable isn't upside down? if it is the floppy light will just stay on..

My TT just has a off the shelf PC shop 1.44mb floppy drive in it, plugged it in and it works perfectly. hardest part is cutting the case to have it fit correctly.

It just can't read, write, or format any disks. I verified the position
of the cable, and even tried it both ways about ten times. The same
floppy drive works fine on the PC.

> My TT just has a off the shelf PC shop 1.44mb floppy drive in it, plugged it

That's what I thought, but for some reason I'm not having much success.

Any other ideas?

perhaps the Atari requires the drive id to be changed.

Infact im certain that's what it is.

See if the drive has the switch or jumper for id setting on its board. I
doubt it, it may atleast have solder pads... they used to.

Pc's use cable select, and its bloody unlikely that anyone in this day and
age would have 2 floppy drives in a pc!

if all else fails, try a PC floppy cable, the one with the twist. at the
last socket after to twist. I don't think Atari's support cable select
though.

All you need is a 192K EEprom set with TOS burned in.
The old plain 520ST already has the ROM sockets on the motherboard so all
you need to do is to replace the bootroms with a complete TOS.

Try searching the leftover Atari vendors for a set of TOS 1.4 chips.
That is the latest version that runs in the 520ST without further
modifications. If that fails you can get a TOS image from the net, split
the file into the correct chunks (programs exist for that) and burn them in
to eproms.
Make sure to get the 6 chip set and not the more modern 2 chip one.

HTH,
Matthias

Greetings,

Well, I looked for jumpers or jumper pads with no success. I also tried a PC cable and put the drive on both connectors. On the connector after the twist, TOS doesn't see the drive at all. I tried three floppy mechanisms.

On the first connector behaves the same as before: there is a boot seek where I can hear the floppy click, and on one of the drives the led flashes. Once in TOS, it reports that the disk cannot be read, even though it never spins.

I have four mechanisms in front of me, but the only one that works is the one from the MegaSTE. That still leaves the TT SOL.

Help! How can this be so difficult?

Aha! After scrutinizing each floppy mechanism some more, I located an set of three solder pads that had holes above them, presumably where the jumper pins might have been installed on a previous version of the drive. I soldered a pair of the pads together and that didn't work, so I undid that and soldered together the other pair. Success!

It appears that the old method would allow manual selection, or cable select if the jumper was off. It may be that the cable select method sees the drive as B when plugged into the Atari cable which is the same as the middle connector on a PC cable. In any case, now since I have soldered in the drive A select, all is well.

What a pain!

Anyone else out there with an Atari and a 1.44meg floppy be aware, replacement could require some soldering.

Thanks a bunch!

IIRC it's not *that* buggy. I've run all my ST software on the Falcon without any major problems and certainly not more problems than on the 1040 ST TOS.

>
> Also what is FPatch? It was on my HD but causes the startup sound to garble

IIRC it fixes a bug in TOS 4 to make the Falcon sound routines compatible with software that was programmed for the ST.

Hi,

This isn't a Atari specific question, but it does pertain to my Falcon RGB port! ;)

I bent a pin on the RGB port and was able to bend it back, but it is a little loose and am afraid it will break off at any time! It is the Composite pin, #12.

What do you atari gurus out there recommend I do to remedy this? Once it is broken how can I fix it? Is it fairly easy to solder on another male DB19 connector?

Tim

I have a question. Do I need to insulate the drive on the HD Bracket? I have a IBM 8GB IDE that I have installed, and of course the screw holes are not lined up so I used Elec Tape to hold the drive on the bracket. I also removed the copper grounding plate. It seems to work ok but am concerned I might damage my Falcon!

Thanks
Tim

What? are you asking me? If so you need to quote the part that I was actually replying to.....

Edward Baiz said-
"Actually, they can be used without the hole being covered, but
sometimes the disk gives woudl give me errors when I used it.
Covering the hole reduced these error occurences."

I just said this statement makes no sense. I know about the hole stuff, I did it myself. But if you are using a floppy this way, IE in a floppy drive that doesnt know the difference between a 720 and a 1440 (ST anyone) then covering the hole - its irrelevant, unless that is youre moving disks in-between systems (ST-TT-PC-whatever). The problem with Edward is that he usually doesnt read other replies before he replies himself and just writes whatever, sometimes confusing what has already been said. I dont have a problem with this cos he seems like a nice-enough guy, ready to help anyone. unlike some other people I could mention *cough*steve*cough*.

If you want me to explain the hole thing, then too bad, enough people have explained it already on here, accurately enough so as even a kiddie could understand it.

Smeg.

Well upon inspection the drive is actually using it's legs to lift the PCB off the bracket like it should, even though it is not screwed on like it should. So it should be ok!

That explains why there was no smoke when I powered up the Falcon030!!! ;)

ALL floppy drive mechanisms sold in the IBM PC market have the drives jumpered or otherwise pre-set with the Drive Select line set to 1,

This means the drives are ALL set up to be Drive B: from the factory.

On an IBM system, the cable with the "twist" at the end takes care of reversing the Drive Select lines so the drive on the end connector responds as the "A:" drive, and the drive connected to the middle connector then responds as the "B:" drive.

This simplifies things because you don't have to worry about changing jumpers when you install the drives.   In a PC.

The Atari requires its floppy drives to be jumpered as Drive Select 0

Thus an "off the shelf" IBM PC floppy drive will NOT work until its Drive Select has been changed from the factory pre-set of 1 to the other position, 0.

Unfortunately, many IBM market floppy drives no longer even HAVE a selectable Drive Select line, because no one ever changes it.

The manufacturers have stopped wasting money on the jumper posts or DIP switches they used to use, and many have re-designed the circuit boards to eliminate the redundant and unnecessary solder pads.

Fortunately, as in this case, SOME drives still have the solder pads which allow changing the DS line to 0.

For those of you who are interested in an auction offering the
following:

  - Atari 2600 with wood finish front
  - 24 Games (some very hard to find)
  - Original Atari 2600 Owners Manual (printed in 1980)
  - Original Game Instruction Manuals
  - a vintage Video Game Center containment box with wood panel finish
& tinted cover top
  - plus more stuff listed on auction site

You can check out the auction I just put up at the following link:

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3025299336

I graciously thank you for your time and I hope to see you there :)

A.D.

I've just 'inherited' an Atari 1040STF.

How do I tell which version of TOS is installed? It has 6 ROM chips.

Also, how do I know whether it is an English version, or an USA version (I am Australian, and I *assume* the computer was sold here originally.

Regards, Bob D

The XControl control Panel is an accessory, place it in the root
directory (not in a folder) of your hard drives boot partition (or
floppy if not booting form a hard drive) and it will appear in the
Desk menu when you reboot. You can download a copy and various
additional modules for it at
http://www.geocities.com/SiliconValley/Bay/8745/, look under Essential
Utility Software. While there you should also take time to grab a copy
of LHarc, STZIP and ST Tools, you may find the HD Free control panel
module useful to.

If you need driver software for you Hard Drive do a search for AHDI
(Atari own driver software) or HD Driver which is what most Atari
owners use, you should be able to download a full version of the
former and demo of the latter. Copy one of these to the same floppy
your storing Xcontrol on, this will be you boot floppy. These allow
you to format and partition you Hard Drive and install driver software
onto it thus enabling the Hard Drive to auto boot.

Hi bob, nice to see an Aussie, The easy way to tell if it is uk/us etc. is look at the keyboard. If it has the pound symbol it is UK. Most (99.9%), of ST's sold here where UK. If it is 6 chip it means it is an early model. Go to the desk menu and select desktop info. It will produce a date for you. it will be either 1985, 1985/87, or 1985/87/89. Which is Tos 1.0, 1.2 and 1.4 respectivly. The dates are just a guess from memory. Also try http://www.megacom.net/~q-funk/ST/

Yes, for some unknown reason the MS-DOS compatible floppy-formatting which
was present in TOS 1.4 disappeared again in TOS 2.06! But if he would
be willing to patch the TOS image in order to enable "HD" formatting,
he should as well activate the patch for MS-DOS format compatibility.
No great knowledge is required in order to do that- just enable the
wanted patch(es) in the already-prepared command file for the patch utility.

The only real serious problem with TOS 4.02 is that it doesn't know
where HD partitions end.  If you try to put another file on a full
partition, it will write the file OVER the start of the next
partition, which destroys the FAT.

You could use TOS 4.02 to boot TOS 4.04 from disk, or you could just
take care to use large (non-full) partitions.

That is really strange. All of the 1.44 and 720 disks formatted on any of my
MegaSTE's, under 2.06 work perfectly under DOS/Windows. What sort of issues
are you guys getting? Data corruption?

OK, so mine is a UK model, and it has TOS 1.0.

Next question:

How can I get a newer version, and is it worth doing?

Regards, Bob D

A bit tricky, you need to obtain new roms. I have probably got spare 1.2 rom's. It very much depends on what you are going to do with it. I am assuming that it is also the big button floppy drive model too? What you can do is get a pair of 256k eproms with tos 2.06 installed. You do need to build an address decoder for this tho. Have a look at http://atarihacks.cjb.net/ under TOS. It should help a little. Where are you located?

Mark

Wow, I asked that question a while ago.
It would be for a falcon (cubase audio only works on that - well, from
an audio point of view)
I do realise now though that the TT's and also the mega STe's can also
have FPU's.
The reason I asked the question, was because I was thinking that
having an FPU may make the falcon work quicker (shared workload across
the processor and FPU) and that it may just appear that bit quicker
(P4 Falcon anyone?   joking obviously)

That said, the start of a new thread, wanting to use my falc for music
making purposes, could I fit an accelerator, or rather, is an
accelerator compatible with cubase / notator

Rob

Well I just installed a 68882 25Mhz PLCC chip in my Falcon030 from an old dead Amiga 4000/030 Rev D MB ;) Works fine. Though it is running at 16Mhz now.

I doesn't make the computer faster, it just allows special software that takes advantage of a FPU work, and run faster. So if you didn't have a FPU installed that software would run slower! Usually Fractal Rendering programs or other similar programs. Not sure about Cubase but I am guessing No on that, check your manual.

Tim

CT60 is rumored to be compatible to Cubase Audio. That of course has yet to be seen as far as I know, but it'll be very cool if it is!

As for an FPU, I don't think it does anything for Cubase. There's really not much it *is* used for, unless you want to run Linux, Ghostscript or other specially compiled math-heavy software, or some software designed for the TT which uses the FPU. I would love to see more done with it, though, since my Falcon has one. My suggestion would be, make a list of everything you want to do with the Falcon, figure out what software you need to do it, and see how much of that uses an FPU. If the amount of software that uses it outweighs the cost of getting one, then go for it! If not, it's not that big a deal if you don't have one. Although, when you do run into the odd program that uses it, it's pretty nice.

Hi

Can anyone help in setting my harddisk back up, and for use with the AT-Speed pc emulator, Ive just erased the lot by accident :(, and I cant access it in Gem either.

I have no harddisk software but I have the software for the AT-speed board.

Many thanks
Anthony.

520STfm, 2.5mb, megafile30.

You need a HD driver for the ST. The ST won't see or be able to use the
Megafile30 without it. I'm sure someone here has the driver.

I think the PATH is being shortened by this line in /etc/rc

```
PATH=/bin:/sbin:/usr/bin:/usr/sbin; export PATH
```

I don't know why Easymint does this. I also discovered another oddity with the PATH.

When I open the default shell from TosWin2 it shows the short path but if I start BASH it shows the long path from the Mint.cnf So I changed the SHELL variable in mint.cnf to point to /bin/bash but TosWin2 still starts /bin/tcsh !? (I have bash, sh, sh.app and tcsh in /bin, they are all different and none says which version they are).

Next I tried to 'login' from the BASH shell. It generates a lot of errors in the console window because it cannot find the password database ?! However it still lets me login as root ?! The PATH is now shown as the short path.

The errors in the login is the reason why I removed it from the boot scripts in the first place.

What I am attempting to do is to tidy up my Mint-Net installation so that it uses the EasyMint etc/rc.d/rc.net script and files. These scripts are failing at the moment so I am relying on running a different /etc/rc.net from mint.cnf before the INIT starts Sparemint.

Regards,

Peter

I dont think you can, unless you buy the whole thing. I downloaded manuals for different versions of cubase from PC/Mac etc even one in spanish, but it didnt work for me, I ended up buying it.

Smeg.

I have just discovered that "route" is in /usr/etc/
and that folder is not available once Sparemint starts because
PATH is changed to the short one above.

This is why the following problem occurs. Is this because there is no login ?
Where should the EasyMint login be ?

Sorry, but Easymint install the route to /sbin. So that's not
installed by Easymint.

Sorry again, Easymint doesn't have a tcsh at all. So with your 'Easymint' installation is something totally wrong.

> What I am attempting to do is to tidy up my Mint-Net installation so that it

Easymint have installation support for MiNT-Net. If you don't install the Easymint network package you you must install and adapt all scripts from hand or copy the network stuff to the correct place there it's expected by Easymint.

I believe you're right. TBH a dedicated answering machine is the better
solution!

I managed to get the disk formatted and for use with the emulator, but as you say, the ST wont see it without the HD driver, which is still the case.

Thanks for the help,
Anthony.

Yes, I have used the VANTAGE 2000 card with Cubase Audio 2.06 for my C-lab
Falcon mkII (with FPU), and it worked fine. The card accelerates the speed to
32 MHz (and installs 14 MB RAM). I cannot understand how I could use CAF
without the accelerator. It's on the edge of being too slow even *with* the
accelerator.
We're talking 8/16 tracks of audio with Cubase Audio's effects and say 15-20
tracks
of MIDI at the same time. Even though the DSP takes care of the audio, the
computer must read the audio from disk and play the MIDI tracks. I think 32 MHz
speed is needed in order to get a decent system running.

Hi Frank,

Yes you are right. I had a VERY basic Mint system on the Milan and I have
installed various Mint-net distributions. I finally got one working when
I got my ADSL broadband modem.

It was then that I downloaded Easymint and installed the Basic package.
I didn't want to risk erasing my existing, working Mint-Net set-up but
the disadvantage is that I am having to manually clean-up the rubbish
from the earlier installations.

I don't know where tcsh came from but Toswin2 always tries to run it.

My Sparemint/Freemint set-up is getting better and I am learning, slowly ;-)

Is it possible to use RPM to find the differences between my installation and the Sparemint rpm files ?

Regards,

Peter

Hi, Peter!

PS> Is it possible to use RPM to find the differences between my
PS> installation and the Sparemint rpm files ?

RPM keeps track of all the files installed with rpm, but has no idea about what exists aside of this. You can check if a certain file comes from an installed package. And you can list all files a rpm would put to your filesystem if you installed it. So the only way to "clean up" was to check package by package.

My advice: do a fresh EasyMiNT installation on a second partition (so that you can switch back to your current installation) and add all rpms necessary to get the functionality you already have. If there should be problems with your ADSL access you still can have a look at your working configuration. This is the only way to get rid of all orphaned files and binaries.

Regards,

Alexander

Proprietary card. Several upgrades were available, and it is possible (though slightly difficult) to make your own card. See http://atari.nvg.org/stacyram/ for details.

> Also, if it doesnt have a hard drive, can I add one, and if so, what
> type do I need.

You can. It must be a SCSI 1, 1/3 height drive. Or you can get an upgrade card at http://www.best-electronics-ca.com/MegaST.htm#If%20you%20own%20an%20Atari

>

Not by any means a guru, but...

a) if you use a VGA monitor, you really don't need the composite pin

b) unless you move the computer, you won't put any strain on the connector

You might try placing a very narrow M/M (or F/F, whichever works) adapter on the port followed by the reverse gender. This will extend your port by about 3/4 inch, but will take the strain off the pin.

Does anyone have a working URL for schematics for the Falcon? I recently killed one, and although my electronics knowledge really isn't up to the task, I don't see how I have any other choice. Dead Falcons are no fun. :-(

I have a falcon030, and a lot of ST games do not work. Some will work from floppy if I boot to the disk and set ST Low.

What software degraders out there allow to get some of those old ST games to run?

I tried Backward III I think it was and was unable to get it to work. It should not be that difficult! It was the demo version, not sure if that was the problem. How do you use this program to do a generic degrade of the machine? I don't want to mess with config files, naming configs etc. Too much work.

On my Amiga 1200 it is fairly easy to degrade to get older games to work, I am hoping the Falcon030 has something similar.

Thanks
Tim

I have a Falcon030. I ran the prg called: NOMEMTST.EXE which disables the
Memory Check on cold boot. Nice feature, but I would like to know how to
reenable it. I tried some Reset NVRAM tools but that did not help. How do
you reset the Falcon to factory settings?

Thanks
Tim

Excuse me???? I do NOT need a flame here. I just made a simple
statement. You tell me why my Atari gives me errors when the hole
is not covered and then no error when it is. I use 2-3 formating
programs on my STe and when the hole is not covered, I get all
kinds of read/write errors.

If you're using 1.44Mb floppies on an ST, the lack (or covering up) of the second hole (the one not related to write-protect), makes the ST "think" it's a 720K disk. However, if your "Atari clone" is the one in issue here, and it HANDLES 1.44Mb floppies (has a 1.44Mb floppy drive), then covering up the hole seems pointless... unless your drive is dying (or seriously dirty/out of alignment) and only reliably read/writes 720K disks nowadays.

Jus' my $0.02.

The 720k drives were designed *before* the 1.44Mb drives existed.
Why would the 720k drives even check for the second hole??? The
answer is...they do *not*.

On a similar note, is it possible to sufficiently upgrade an STE to run
Falcon games? I know very little about Falcons, but I gather they use the
same OS.....or would that just be too much to hope for?

Well if the game was written for the Falcon specifically then NO.  As the
```

```
Falcon has better sound and graphics capabilities.  16bit audio and True
Color graphics will not work on the STE.

Electrically, they WILL interchange, it would mean cutting the case though.

Well I have the one with the regular square eject button, not the large one
like on the old 520/1040ST's.
I think it is a half hight mech.

What are my options on replacing this mech and NOT hacking the case?

Thanks all.

Tim

So in using a PC drive for a External SF314 unit, (B: Drive), would one need
to leave the drive to ID1?  Or does it need to be at ID0 like the internal
drives???

Tim

I think that it has to be left set to A: and that being on the external connector probably makes it B: Its been sooo long since I had a two drive atari setup ;-) sorry. If you get hold of a PC floppy drive (or use try the one out of your desktop PC if you have one) just connect it to the SF314's cables (Pin 1 may be on the other side of the drive so be careful, some had to be fitted upside down), and see if it works as it is. If it does then the SF314 drive is set to drive B, if not, drive A.

I do remember fitting a switch to my STE to swap the drives from A to B and B to A. Why I did this though I cant remember.

What I can tell you though, is only the PC used the twist floppy cable method to change the drive back from B: to A:. Historically this is because

when 3.5"s were introduced everyone had 5.25"s set to A: So the easiest way
was to have the 3.5" come set as drive B from the factory, which was usually
supplied with a little adapter that would change the 5.25" connector on the
floppy cable to a 3.5" type. No twist was needed until the 5.25" drives lost
popularity and stopped being fitted and the 3.5" needed to be set to A:
which was impossible on some models, hence the twist method.

Smeg.

Good Day All

I am new to this group, and have been looking into the postings for hooking up an Ethernet interface on my Atari's.

Does anyone know if Mr. Lyndon Amsdon is still offerring his ISA card and ST interface hardware? I have sent him an e-mail but have not yet gotten a response.

I have heard back from Mr. Elmar Hilgart, and I may be going with the parallel/ROM/Pocket Ethernet interface that he has. He dones not currently have any of the EtherNEA or EhterNet Adapter II's available.

But are there any other solutions available?
Does anyone have the schematics for building my own ISA/ROM interface?
Does anyone have the schematics for building my own ISA/ACSI interface?
Does anyone know of a web site that has the schematics?

I expect to have several ST's running when I get done setting up all the hardware that I have accumulated over the years, so the Ethernet setup will make it much easier to deal with printers and moving files. It will also make it easier to get files in and out of my Linux and Winblows PC's.

Larry

I built an ISA/ROM interface from the documentation on
http://hardware.atari.org/ You can see photos of this at
http://www.dwade.freeserve.co.uk/atari/main.html

I am not sure that it is much help with printing. You can move files but
again its not straight forward unless you run MINT.

```
>  It will also make it easier to get files in and out of my Linux and
> Winblows PC's.

Again you may have to fiddle about until you get a set of programs that
work....

Actually the reason for the twist in the floppy drive cable goes back
a lot farther than that.

When the IBM PC computer was introduced, hard drives barely existed, and were terribly expensive, and floppy drives weren't much cheaper.

Thus the typical IBM PC computer sold had only a single 360K floppy drive.

Naturally it didn't take long for the new computer owners to discover they couldn't do much with a single drive system, so they'd end up taking the computer back to the store to have a second floppy installed.

And of course, that was a pretty expensive proposition, having an IBM store install hardware for you.

So people discovered they could buy the floppy drives as "spare parts" and install them by themselves, and it was a LOT cheaper.

But---

Nobody told them that the Drive Select jumpers had to be changed to make both drives respond properly.

So IBM started getting a lot of complaints about the "defective" replacement floppy drive mechanisms they were selling- (and eventually discovered those were actually being installed by users as "B" drives, not as replacements for "A" drives as they were sold for.)

Rather than try to educate the users about changing jumpers and things, IBM finally introduced the "twisted" floppy drive cable.

This allowed ALL floppy drives to be sold with the jumpers set to "DS1" which makes them the "B" drive. This means anyone can buy a floppy drive, plug it in, and it becomes the second drive in a two drive system, without having to change jumpers or anything.

Then by using the twisted cable, the Drive Select lines are reversed, making the replacement floppy drive also function as an "A" drive if it's needed to replace the existing drive in the computer- again, without having to change jumpers or anything.

As long as you put the drive on the proper plug, you were set. And since most computers were sold with the "A" drive already installed, it was a simple matter to just plug your new "B" drive into the only open connector on the cable, and it would work-   without having to change jumpers or anything.

Tech support problem solved.

What that means of course is that ALL floppy drives sold for the IBM personal computer market have their Drive Select jumpers set to DS1, or "B" drive.

And further, since NO ONE ever changes the jumpers from "B", many manufacturers of floppy drives have simply eliminated the manufacturing cost of putting jumpers on the drives that no one is ever going to use anyway. That makes it awfully difficult for the few computer users in the world who need to have a floppy drive set for DS0 (like Atari owners).

And then of course, in the wisdom for which they're known, IBM introduced the "Master and Slave" jumper settings for hard drives.

Which are exactly the same thing they tried so hard to eliminate with the "twisted" floppy drive cable.

Go figure...!

BobR

Hi all,

Has anyone else been having a look at the Draconis pre releases ?

I think Pre9 is the latest one. I've been having a dabble and have sent a few problem dumps to Jens but I've not had any replies. I assume he is busy investigating the bugs.

Regards,

Peter

hi,
is it worth emulating the atari st for any particular games? since i already have the amiga emulator uae i can already play rather many games that i used to own for my old amiga. however i was wondering if there are some particular games / programs for the atari st that have no equivalent for amiga or that at least are better on atari st.

Regards

S.

What's a used VANTAGE 2000 card for the Atari Falcon (incl a 16 MB SIMM module) worth?

The card speeds up the CPU clock to 32 MHz and gives the Falcon 14 MB of RAM.

Kind regards
Mikael Hillborg

Maybe because you had a single-sided drive built in and wanted to boot off the DS B:\? That was the case with my STFM and it was modified by Evesham Micros when I bought it to do this. It involved swapping pins 19 and 20 of the Yamaha sound chip with a double-pole 2-way switch.

If all else fails, it might be possible to use PC drives that can't be reset easily to A by unsoldering (or cutting) these 2 pins and cross-connecting them with bits of wire (i.e. pin 19 connected to pin 20 pad on board and vice versa).

No STE's came with single sided drives, so no, that wasnt the reason.
Probably I just liked any excuse to take a soldering iron to my machine.
Either that or it was so I could multi disk games without having to swap
disks all the time.

Hi Guys..

OK, what's the minimum version of Plain, Standard, Unpatched TOS that will work with a 68010 CPU? In a stock 1040STFM, 1.02 + 68010 = whitescreen, some floppy access, then a reboot (and repeat). Several very old news postings archived at groups.google.com suggest a design change in the '010 is responsible, and that at some point TOS was made CPU-aware (ie 4.x works on a falcon with 68030), and the problem is thus fixed.

I'm thinking of fitting TOS 2.06 anyhow at some point, but if I can do a quick-and-dirty test by using a V1.xx (no need to build the ROM-socket-mod) ROMset, that would be good. NB: I don't wish to use KAOS or other non-official modified TOS versions if at all possible.

Thanks...
        Craig

Thank you for this very clear explanation, indeed.

Bye,
/Pascal/

I would probably pay $100USD for it, give or take $50.

I'm fairly sure that the PAK030 accelerator board for ST's uses TOS 2.06.
I imagine that this is the version of TOS you'd want even if it isn't the
lowest version of TOS that will work.

Thanks,
Mark

YES he is! I got an e-mail from him less then an hour after I posted this message. He is waiting for PCB's to come in, and will e-mail me when they are available.

Tim

One of the issues with the ICD Link 1 was not knowing if it had enough power. That is why the Link 2 has an LED to indicate that it has power. I am using a Link 1 with a Mega2, a SyQuest EzFlyer 135, and a 5 bay SCSI chassis. Hooked up as: Mega2 ACSI -> Link -> EzFlyer 135 -> 5 slot chassis -> terminator. This has been working quite well. However, in various configurations I have had the same problem you are reporting, and I have had it with an ICD AdSCSI Plus as well, even though that adapter requires a power supply. The terminator on the EzFlyer 135 is critical! The 135 does NOT have a built in terminator so an external one is required. Often, the lack of a terminator is just as bad as a failed SCSI device, bad cable, or bad controller!

Larry

Thanks for the reply. Well I do have this terminator on the EZ135. It has a green led on it so I think it works. Does it matter on which connector I put the link on? I tried either one and it does the same thing. Nothing. If I mess with the link enough it will eventually work but then stop a minute later. Must be the link that is bad!

>Thanks for the reply. Well I do have this terminator on the EZ135. It has
>a green led on it so I think it works.

Means that the drive is getting power from the supply, that's all. When you put a disk in the LED next to to the eject lever should indicate activity.

>Does it matter on which connector I
>put the link on? I tried either one and it does the same thing. Nothing.

Doesn't matter in the slightest.

When you boot from a driver on a floppy there should be some kind of report as to what devices were found on the SCSI bus?

>If I mess with the link enough it will eventually work but then stop a
>minute later. Must be the link that is bad!

Have you tried another terminator?

Is there a SCSI drive hanging around that you could try? Even if it's a bare drive you could unplug the EZ135 actual drive and plug the hard drive in its place?

Cheers

```

Tim,

To be quite honest MiNT is (in my humble opinion) quite useless on a 4 meg machine. It's something that requires a bit more horsepower as well. Even on my 16 MHz STe I found it to be slow. I found instead that MagiC was the perfect balance of speed, features and ram consumption. MiNT is more stable than MagiC (some people will bitch, argue, whine and otherwise be dicks about that statement, but it's truth). But MagiC is really cool as an OS and will make your Atari feel faster (much faster vdi and disk access), and the desktop is faster too. You can get MagiC from http://www.europe-shareware.com (or .org, can't remember). It comes with amanual but the manual might be german only - again I can't remember. The manual is unimportant. It's a simple install.

Hope this helps,
Thanks,
Mark

Tim

Is the light on the terminator or the front of the EZ135 drive? If
it's on the drive it has no relevance to the terminator/Link.

Since 'messing' with the Link seems to make a difference, you may have
some cold solder joints on one of the connectors in the Link. You
could try to pry open the clam shell of the unit and check the
condition of the solder between the PCB and the pins of the
connectors. If anything looks cracked or broken use a low power
(20-30w) soldering iron to fix the joint.

The manual (of MagiC) is in French if you buy through Europe Shareware.

Bye,
/Pascal/

In order to support true virtual machines certain instructions, specifically
those that test to see if the CPU is in user mode or supervisor mode need to
generate an interupt. That way a hypervisor can fool programs running in
user mode into beleiving they are in supervisor mode (sorry I can't recall
what the two modes are called on the 68K but I think you get the picture).
This support was added in the 68K.

It must be at least a TOS 2x. AFAIK none of the TOS 1 versions support this
feature

So there are Shareware only? What all are freeware?

What are the limitations of shareware? I am not looking to spend money
right now until I find one that I like, and that is in the English Language.

Thanks
TIm

I do have a Quantum 810MB HD in a SCSI-1 Enclosure and I tried that and I
couldn't get it to work at all. I have not tried a different terminator.

When I boot from the ICD HD Disk it always says no adaptor is present.
Should it say something if JUST the link is attached w/o a HD?!?

Thanks
Tim

So what is the issue with not having enough power? Does this involve the
terminator or is that something else? So what can I do to make sure there
is enough power?

Thanks
Tim

(followup to comp.sys.atari.st)

Hello,

  in article <vb304snbrug923@corp.supernews.com> (comp.sys.atari.st),
  Tim wrote on Thu 01-05-2003 13:16 (-0700):

> So there are Shareware only? What all are freeware?
>
> What are the limitations of shareware? I am not looking to spend money
> right now until I find one that I like, and that is in the English Language.

I'm not sure to understand you correctly, or maybe you didn't understand
me nor know Europe Shareware.

We are a non prorit organisation.
We are based in France at the beginning, then North America and Spain
joined us.
Our main goal is to promote shareware and to be an easy way for the
users to pay the shareware fee, as did previously some other
organisations (Joe's and Dennesh's ones, if you remember).
An other goal is to fight against software patents in Europe (a very
important topic for the whole community of programmers).

With the lack of Atari dealers in France, we also decided to sell some
famous applications like the one from Anodyne (CD Writer and ExtenDos),
ASH, Invers (Porthos and Calamus Lite, that are shareware in fact).

But about MagiC and other ASH applications, we do not own the rights on
the English docs (System Solutions usualy does, translations done by
excellent team DDD).

Next question? :-)

Best regards,
/Pascal/

I need to know how the Link normally works. I have one that seems to not work but I am not sure if it is due to bad termination or power problems.

When the Link is connected to a DMA port via DMA cable, and the ICD Tools disk is loaded, should it say Host Adaptor not found? Or should it list the Link? I get host adaptor not found. Also what tools on the disk can I load to tell me the link is working properly? I don't want to buy another one if this one is working ok and I am just being dumb somehow!

I have a EZ135 and a terminator with a LED on it, so it should be terminated ok. I also tried a Quantum 810MB SCSI HD in a SCSI Enclosure.

Thanks for your help,
Tim

The Link needs terminator power from the scsi bus in order to work. Not a whole lot of drives out there provide this and even more of them need to have a jumper switched. My Link has a small LED right where the "i" is in link to let me know it is powered up. If this isn't on, it isn't receiving termination power (which it draws on to power the host adapter). Without power the host adapter might as well not be there even though it might very well work. I'd check on this... It's probably what the problem is.

Termination is not that big of a deal, you'd probably detect the drive but get strange errors. At very least the link would be found.

Thanks,
Mark

>> Is there a SCSI drive hanging around that you could try?

>I do have a Quantum 810MB HD in a SCSI-1 Enclosure and I tried that and I
>couldn't get it to work at all. I have not tried a different terminator.

The fact that you can sometimes get the Link to work points to a problem with either the Link (including its cable!) or the termination. Get inside that external drive and using the manufacturer's data sheet, make absolutely sure that it's set to provide power to the termination (TERMPWR). If the drive has its own termination on the PCB still, then make sure that is also enabled, and try your test again *without* the external termination.

I think that that will track your problem down.

Cheers

Derryck

>The manual (of MagiC) is in French if you buy through Europe Shareware.

You can buy an English manual and MagiC program from Atari Workshop
info@atari-workshop.co.uk. They should have the latest 6.20 version.

I disagree with a previous post about the manual not being of much
use. There are some features that need the manual, specially if
you are not familiar with the program and associated sub-programs
included with the bundle. I feel the manual could be a lot better
than it is, but that's another matter...

Regards, /Peter/

I have a PC CD called the Atari Anniversary Edition, made by inforgames it
has most of the famous Atari coin op games and they run from some kind of
emulator.

That is one option, the other is a TOS 3.06, both are heavily modified
though!

Hello Larry,

Yes Lyndon's hardware/software is still available. Infact, I use
it with my STe and it works great. I have my Hades, my STe and my
wife's PC hooked up to my Lan/router/cable modem. All function
well and can access the Internet.

I just got a used Falcon, but it comes with no System Software. I am
talking about the Language Disk, Extras and anything else that was shipped
on floppy. Does anyone know of a link, or that might have them they can
email?

Also what HD Driver software will work on it? I guess this has a IDE and
SCSI so I am assuming I need special software to get the HD to work? I have
a 2Gb and a 4Gb 2.5" EIDE Laptop HD I want to use!

Thanks in advanced!
Tim

Ok. So I won't use the Falcon as a web server (got a Linux machine instead).
But what could one really use a Falcon for these days? Hehe, well I mean I'm
annoyed by the fact that it just lies around in the closet. It's got 14 MB and the
Vantage 2000 card, which speeds the processor to 32 MHz. Such a shame it
just lies around for no use. It's quite compact, with it's built-in hard disk etc.

There must be *some* use for it? Any recommendations?
I searched wuarchive.wustl.edu for the classic Atari archive but it seems to
have been removed, right? Which are the most comprehensive Atari software
archives on the net today? Wuarchive used to be the best, at least back in
1989 :-)
Software can maybe give me some ideas what I should use this puppy for...

How about a home alarm system? Is there any software for that?
Or a telephone answering machine? But that'd require an external modem, right?

m

Strangely enough the only really useful stuff on the 'language' disks are
the hard disk drivers. Search the net for AHDI and that will give you a hard
disk driver that will be pretty much all you need for a start.

Nothing interesting is on these disks.

> Also what HD Driver software will work on it?  I guess this has a IDE and

```

have
> a 2Gb and a 4Gb 2.5" EIDE Laptop HD I want to use!

Best bet, go for HDDriver from Uwe Seimet. It will handle those larger IDE
drives just nicely. If you want to use both drives at the same time, you
will have to set the ID jumper on them and get a 2.5" cable with 2 drive
connectors on it, and make sure it isnt longer than necessary or you will
have problems.

There is software available to turn it into an answering machine though I have never tried it.

My Falcon is upstairs in my music studio, being used as a midi/hard disk recorder. Most people who use a Falcon, use it as a desktop machine in a similar way to those who use a PC. Dont think that just because its old, it doesnt mean that you cant [compose/word process/desktop publish/program/design/browse the net/email/play games] (circle one) with it.

Smeg.

I've also heard about this but never saw that software. It seems like it was one of those software packages that were announced in that flashy Falcon brouchure as "under development", but maybe it never was released?

Well I am a musician and a programmer, but I have a windows machine for HD recording and after all, the Falcon running Cubase Audio 2.06 is quite lame in comparison even though it's fully expanded with a whopping 14 MB RAM and double processor speed at a lightning fast 32 MHz. And that's true for almost all other apps, like desktop publishing, games, programming, web design, browsing the net, email etc. It seems unncessary to use it when it can be done easier and faster on a Mac or PC. So that's why I was looking for some app where it can be put away somewhere and switched on all the time, e.g. an alarm system or answering machine etc.

I have for sale the following Atari ST hardware and software:

Hardware:
- Atari 1040ST with a 4 meg memory upgrade
- SM124 B&W Monitor
- SC1224 Color Monitor
- SF314 D.S. Floppy Drive, 2
- GT1000 5 1/4" Floppy Drive
- ICD Fast 50, 50 meg Hard Drive
- Monitor Master monitor switcher
- Drive Master drive switcher
- Panasonic KXP 1124 Dot Matrix Printer
- Spectre GCR Mac emulator
- PC Ditto II IBM hardware emulator

Software:
- Games:
  - Orbiter by Spectrum Holobyte
  - Bismarck by Datasoft
  - Sim City by Electronic Arts
  - Arctic Fox by Electronic Arts
  - Q Ball by Mindscape
  - Go Moku/Renju by Atari
  - Populous by Electronic Arts
  - Word For Word by Bayview(Crossword Game)
  - Joust by Atari
  - Missile Command by Atari

- Productivity:
  - First Word Plus
  - Data Manager by Timeworks
  - Typesetter Elite by Xlent Software
  - Print Master
  - Print Master Art Gallery II
  - Print Master Interface

- Graphics:
  - Cad 3D 2.0
  - Degas Elite
  - Genesis
  - Spectrum 512
  - Cybermate & Upgrades

  - Cyber Sculpt
  - Cyber Texture
  - Cyber Paint
  - Microbot Design Disk for Cad 3D & Cybermate

- Programming:
  - Megamax C & DB
  - Megamax Laser C & DB
  - GFA Basic
  - GFA Compiler
  - Prospero Pascal for GEM

- Utilities and Miscellaneous Software:
  - Echo(X10 controller programmer) Michtron
  - Maxifile III by Codehead
  - Neodesk by Gribnif
  - Codehead Utilities
  - Warp 9 by Codehead
  - Multidesk Deluxe by Codehead
  - PCDitto software(IBM Emulator)
  - Universal Item Selector III by A&D Software
  - Masterlink ST(modem program) By Intersect
  - DC Utilities by Doubleclick
  - Squish(Compression program) by Trace Technologies
  - Data Diet by Double Click
  - Data Diet 2 by Trace Technologies
  - Interlink ST(modem program) by Intersect
  - Multidesk by Codehead

Also; Many magazine disks from most of the popular Atari ST magazines.
Probably in excess of 150

I offer this material to any interested people until May 16.
The highest of any offer for all or any part of this collection gets it.

Please contact me via email.

Remove the spaces for the address: "emelvin @ direct .ca"

Thanks in advance for any interest shown. Ed

Will this work with the Link 2 also? How about the ICD Mega Micro?

As far as I know almost all TOS versions support autobooting hard drives.
However TOS versions less than 2.0 do not support autobooting from an IDE
interfaces, such as the Mario Becroft design.....

All of versions of TOS support autobooting of the hard disk, however, you need to have the hard disk driver in order for the drive to autoboot.

The ST was not designed to recognize the HD without the driver.

I have those utilities and use them with the ADSCSI micro controllers in my
Mega's.   If I'm not mistaken, the software works with all of ICD's stuff.
Don't bother calling them for info.   You'd get better attention from a
block wall.  They no longer support, nor do they care to talk about it with
you.

Good thing is we still have these news groups for support.

No, the ST will recognize/execute a boot sector directly from the hard disk, provided, that this one has previously been installed thanks to the appropriate driver (ahdi should be enough at first).

The TOS checks the ACSI connector when booting to see if theres a bootable
hard drive on it. If so, it boots. If not it goes to the floppy drive. Its
also possible to autoboot from the cartridge port, i cant remember if it
checks this before the ACSI port or what order its in.

Smeg.

-------------------------------cut-------------------------------
The last version of AdSCSI 6.5.5 Software is available for download. It is in
ZIP format and extracts to a single 720K floppy diskette. This software will
work with all ICD SCSI host adapters including the ICD Link and Link 2.

Hi Tim!

No, only the first time you use the driver software. This installs
the driver on the boot partition of the hard drive. You then need
to install the icons for the drives manually with the TOS desktop
- others like Thing and jinnee have an 'Install drives' or 'Mount
devices' menu function to do this. Don't forget to save the desktop
or configuration, so that the drive icons will be there next time
you boot.

Note that you should keep a copy of the driver software handy on a
floppy, just in case the boot sector gets corrupted.

Regards, /Peter/

Great thanks,

So what HD software do you recommend? I will be using ICD's The Link 1 and
a Quantum 810MB SCSI drive.

Tim

Free: AHDI

Not free, but should have been included with your Link: ICD

Not free, but very powerful and worth purchasing: HD Driver

Note that you will have a 512Mb partition limit if you use normal TOS.
Thus, your drive will require at least two partitions.

Ok thats cool. So what kind of partitions will allow 512MB? I have TOS 1.04.

With TOS 1.04 the maximum partition size is 256 MB. For 512 MB per partition TOS 2.0x is required. YOu do not have to take care of the partition type. The software used for partitioning the drive will handle this automatically.

Hi Tim!

The best undoubtedly is HDDRIVER from Uwe Seimet, but that's commercial although you can download a restricted demo from
http://www.seimet.de/atari_english.html
if you have web access. It's just possible you may need to buy this one, as some Quantum drives need either parity checking or initiator identification to make them work - not sure if yours is one of those. It's available with English manual from Atari Workshop (mail them at info@atari-workshop.co.uk, or see www.atari-workshop.co.uk). Price is UKP 29.95.

Alternatives are the Shareware (or PD?) CBHD by Claus Brod and I
understand that the last version of ICD's driver can be downloaded
free too - there was an address for this recently in this conference.

Regards, /Peter/

Hi Uwe,

While I don't doubt you, I did take the time to look up the maximum
partition limits and I read that 1.04 was the first 512MB capable OS.

Apparently what I read was wrong. So all 1.x TOS has a 256MB
partition size limit?

I'm not sure about TOS 1.6, but 1.0x has a 256 MB limit and I think it
is the same with TOS 1.6.
With TOS 1.0x the maximum number of sectors per partitions is limited,
which results in the 256 MB size limit.

Install half decent MiNT setup, I'd recommend Easymint, download the Apache RPM package and you're set. But.... The falcon is awfully slow. It'll serve up static content plenty fast, but don't expect stuff like PHP to be even remotely tolerably fast.

Thanks
Mark

With MagiC and MagxNet installed you can have an ftp server.

MagxNet/FTP server: http://users.otenet.gr/~papval/

>I realize I'll need a TCP/IP adapter for that as well. Any pointers?

I'm using a Genius LAN parallel port ethernet adaptor, which is plugged into my Falcon's ROM port using a small adaptor board. Hmm, can't remember the designer's name, but it came from Germany.

I don't know about Web servers, perhaps there's something that will run under MiNT or whatever.

If you have a connection with dynamic IP assignment you should investigate ways round this before proceeding. I'm using a hardware router, but can only access its settings menus from a Java-capable browser.

You would also need to use a service such as dyndns.org, and hope that your IP address doesn't change often. Hmmm.

Cheers

Derryck

If you use freeMiNT it's surely possible. To install MiNT/MiNT-net get easyMiNT. Like the name suggest it's really an easy to use package and above all it installs the Redhad Package Manager (RPM) for you. Installing additional packages is that way a piece of cake.
The package itself doesn't install a webserver but you can find the Apache webserver (and if needed a ftp-server) on the sparemint webpage.

<URL:http://atari.st-katharina-apotheke.de/home.php?lang=en&headline=EasyMiNT&texte=easymint>

<URL:http://sparemint.atariforge.net/sparemint/html/packages.html>

Getting a Genius LAN E3000III (I found it here http://www.myatari.net/issues/
jan2001/united.htm)
won't be easy because it's not being manufactured anylonger. And even if it would
be, then I
now realize that I could probably get a cheapo Windows machine, run Linux with
Apache etc
for the same amount of money so I guess there's no point other than the fun
factor :-) Now
what the h*ll shall I use my Falcon for :-)

But what about the LAN port of Falcon???? That has always confused me. It's not an
ethernet
LAN port right? At least the connection isn't.

M

Does the FALCON have a ROM port. Will the EtherNec stuff work
(http://hardware.atari.org) ? I know the Realtec Cards are getting hard to
find, but I still manage to pick the odd one up here and there, and I know
Lyndon has some...

Thanks for all the replies. I now have another question. Can I format my
Quantum 810MB SCSI HD on a PC in FAT and use that with the atari? That way
I can transfer all my programs from STeem to it and just plug and go! If so
what HD driver software will allow this and what size should I partition the
drive? Also would it matter if it is Primary and Extended in PC and will it
work on the ST? Currently it is one large FAT 808MB Partition on the PC.

Thanks!!
Tim

You kan skip all MiNT etc advices if you wich...

Just Install STinG from http://www.ettnet.se/~dlanor/ and get the webserver Weblight from http://obooklage.free.fr/ . Then all you need is a nullmodem cable and another computer capable of routing traffic to a serial port subnet using SLIP.

http://home.arcor.de/thomas.redelberger/prj/atari/etherne/index.htm vill get you an Ethernet solution so you can skip nullmodem using subnets.

This solution will even work from single TOS as long as you keep it static with nothing but standard html files.

I have kept Weblight online for 2 1/2 years now with very few problems. First using nullmodem and then with (another) Ethernet adaptor and a 4 MB ST RAM TT. Check out http://atari.mine.nu/ to visit this server.

You may also be able to get Debian m68k Linux running on your Falcon. I've actually played around with that on another (36 MB RAM) TT and it runs quite nice but slow. Apache 1.36 just installs itself with very little hazzle once you get Debian running. With this solution you will have to stick to nullmodem, I think, as there are no Linux drivers for any Ethernet except the older VME bus cards.

It becomes quite pointless if a second computer is needed.

>
> http://home.arcor.de/thomas.redelberger/prj/atari/etherne/index.htm vill
> get you an Ethernet solution so you can skip nullmodem using subnets.

A network card is needed as well, so I'm not too convinced that it's a good
solution.
It becomes a bit pointless when I could easily find a used Intel machine for less
bucks
and install Linux, Apache and even PHP on it. So I'll probably scrap the idea.
Damn
Atari, they should have included networks cards on the later models, e.g. the
Falcons.

Tim wrote:

> Thanks for all the replies. I now have another question. Can I format my Quantum 810MB SCSI HD on a PC in FAT and use that with the atari? That way I can transfer all my programs from STeem to it and just plug and go! If so what HD driver software will allow this and what size should I partition the drive? Also would it matter if it is Primary and Extended in PC and will it work on the ST? Currently it is one large FAT 808MB Partition on the PC.

With MagiC or MINT you can read and write PC-compatible FAT or FAT32 partitions.
Without MagiC or MiNT you can create a single (!) partition that is both PC and Atari compatible with HDDRIVER. Note, however, that only one partition per hard disk drive is possible in this case. As the maximum partition size for the ST is 256 MB and for a MegaSTE/TT is 512 MB you would not be able to use the full capacity of your drive.

IIRC the Falcon Manual states that it is a MAC (Apple talk) compatable
LAN.

Sell your falcon to me, so in May I can have an untouched falcon, and a
C-Lab CT60 bastardized falcon on crack. ;-)

Heh, it's not for sale. To many cool memories with that machine. I'll keep it.
And who knows, maybe I'll do some DSP hacking in the future.

Kind regards

You can also try to clean the disk drive heads with a disk cleaning kit.
Then get a new disk and format the disk and see if you get errors on that.
Maybe convert a .ST disk image to a new disk and run that, maybe your old
disk are dirty and will dirty up your heads after you clean them?

Tim

Also, the old drives were not servo-controlled, their speed may vary a bit over time. There is a small control inside the drive to adjust the speed (300 rpm) and there are a few programs that display the speed of the drive in real time.

Good Luck!!

I got the Link 1 from a 1040STE bundle off eBay and it seems the adaptor is bad. When I hook it up to a SyQuest EZ135 and run the ICS AdSCSI tools on bootup 9/10 times it will say no Host Adaptor. I have been able to get the unit to work a few times (actually booted off the EZ135 disk) but it definetely seems it is bad. Has anyone else seen a problem like this with these?

I also tested the DMA cable pin for pin and it seems to be ok, so I doublt it is the cable.

I guess I will have to go ahead and buy the Link 2 after all.

Thanks
Tim

Does anyone know of a good drop in replacement PeeCee mech for a dead SF314?
Mine makes a weird noise and spins forever when turned on.

Tim

I dont think there is one anymore, at least all the PC floppy drives I have seen lately dont even have the ID jumper anymore, so you wont be able to change it from drive 1 (PC A:) to drive 0 (Everything else A:) unless you can find the right solder pad.

You might have some luck if you know a local computer dealer who has loads of used floppy drives, and you know him enough for him to let you look through/test them all.

Smeg.

It should. I think all drives in the Mega ST range were double sided from the word go, so you shouldnt even need to modify the SF314's case.

Smeg.

Hi Tim,

The Links can go bad, but I wonder if there is a timing issue. Try
booting with the Syquest off. Then turn it on and wait a minute or so
before trying to access the hard drive with utility software from the
floppy drive. I'd also try adding an external terminator to your
Syquest before giving up.

Galen

That would depend on the mech itself. There are 3 different ones that Atari
used.   The 1/3 height (5/8" wide "rhombus" shaped button on the lower right

side), the 1/2 height (1 3/4" "rhombus" shaped button below the drive opening) and the 1/2 height (obsolete square button on the lower right side) drives. They will not interchange. Make sure the drive is correct for the case you are using.

Uwe,
        You wrote HD Driver correct?   And if so, is it the only software
I'll need to make this collection of drives work correctly? It all has the
ICD hardware installed. AdSCSI Micro is what connects the drives to the
Atari bus. Let me know if that's the case and I'll send the $$ for the
software.

Thanks and thanks to Joe for the input

There should not be any problem with your using HDDRIVER. I suggest that
you simply try the demo version, available on
http://www.seimet.de/hddriver_english.html.
Note that I can only send you the software with a German manual. If you
prefer an English manual you should order HDDRIVER from Atari Workshop
in the UK.

Signed you off?! Lucky he didn't take opinions from round here!

I'm starting a new job next week myself, so I'm coming to the end of a very nice 3 week break.

The ominous news is I've just been doing an M$ Office course (coz I've been making it all up for the last few years). I've done about 24 sessions of a 40 session course, completed 2 of the 3 parts already as well as 3 other parts tehy weren't going to let me look at and I've still hardly learnt anything new. There are still so many parts of Windows that aren't a patch on Magic...

The even-more-ominous news is that the order has finally gone in for the PC (AMD2400+XP) so it looks like I'm in the home straight with the TT B^<

I think I'm going to have a stampede on my hands...

regards
Harry

The adspeed driver consists of adspeed.prg which you run from your
auto folder depending on which speed you want. You can then run
16mhz.prg or 8mhz.prg to switch speeds, or you can also run 16mhz.prg in
your auto folder to boot at 16mhz. I have to disable the drivers to run
Notator SL, which is the primary use for my 1040STe, and it runs fine
without them. There is a significant increase in performance running at
16 Mhz for other stuff though.

The ST will not "see" the drives without some sort of HD driver software
installed.

Bitch!!

> I'm starting a new job next week myself, so I'm coming to the end of a
> very nice 3 week break.

I've had a 2 year break now, and still havent done half of what i intended
to do in my 1 year break.

So i'll be getting a few more emails from you for a while then. 8~)

> I think I'm going to have a stampede on my hands...

That should be worth a bit. But before you part with it, use Papyrus to sve all you importanat documents as RTF so that word will be able to read them

Hello,

I have a working 1040 ST, a couple of monitors, hard drive, software, Atari programming books, etc. that are looking for a home. Hate to just throw them away....I live in Simi Valley California (near North West Los Angeles)..... If anyone wants any of these items (for Free) or you know of anybody, Please contact me at Dauclair100@aol.com

Richard

Joe,

Would you happen to have the complete software? Mine is only the adspeed.prg, no others.   Also, if you happen to have the ICD hard disk utilities, can I get you to send them both to me in email?   I called and spoke to Tom at ICD and he has nothing left in his Atari arsenal.

Thanks
Jon

You shouldn't start swapping software from different cards, the Adspeed could be one of 4 address permutations, anything but the correct address is useless, if you have adspeed.prg you can rename it to adspeed.acc to get the accessory version, make sure you keep a backup because of the problem i highlighted above.

ICD is commercial software, no one should email you a 'copy'.

So, how does one get ICD software anymore? ICD is no longer selling it.

I want a copy of their hard drive utilities with cleanup. I own 2 ICD controllers, but the software I have is very old (5.2, I think).

I would like to network my Falcon to my 130XE in some fashion. Has anyone reading this newgroup already done this? I know about the SIO2PC cable. Can something similar to this be done with a Falcon? I really don't want to clutter up my office with a PC. My Atari computers already take up all the space :-).

Someone will have to sell you their package in its entirety, removing all semblance of the said package from their system.

What is it you are trying to achieve, there are various free options to most Hard disk related problems.

For the AdSCSI Plus you can download the version 6.5.5 from the ICD homepage.

Hi all. (Excuse any repeats of this msg - my mail/news server is useless)

Recently I built the Rom port EtherNec on this site:

http://home.arcor.de/thomas.redelberger/prj/atari/etherne/

The ethernet card gets power and lights up on the hub fine, but I cant seem to get life in the software side of things.

Heres what I have:

Atari 1040 STFM with memory upgrade to 4MB.
EtherNec adapter (built into Atari).
Choice of 2 network cards:
            -Genius LAN GR1222
            -AT/LANTIC DP83905

Both are NE2000 compatible, both are ISA (or they wouldnt fit)

Has anybody got the EtherNEC (not EtherNEA) working on an ST (not Mega), is there any tips u can give or a working setup you can email (fit on a 720 floppy?).

Thanks.

Dan.

Find and purchase an RTL8019 based Ethernet card to put in it. I have found that the 9 different ISA NE2k chipsets I had didn't work, RTL8019 is what the developer made the card with, so it will work guaranteed. After I got this I had no problems. As far as how well it works, you shoudl be able to set it up with basic instructions and should be able to ping another host on the ethernet lan. Or if you're hooking it up to an adsl router you should be able to ping htat ip address if you know it. Sting's dialer has a ping utility.

Thanks
Mark

I could DEINITELY use the icd link cables (and myabe a replacement floppy or two and a hard drive) - how much do you think it would cost to ship them to Europe?

There is a program called 80XLDJ that works with the SIO2PC cable
that allows a ST or Falcon to connect to a 130XE or 800XL. The
program emaulates an 8-bit disk drive and allows loading of DI
image files. YOu can adjust the file on the ST or Falcon and have
it load into the XE by just reseting the XE. Works great for me. I
have made alot of DI image file of various games and other
programs. Check it out at:
http://wwwstud.ira.uka.de/~s_tomczy/dj800.html.

Also check at an article I wrote on the subject:

http://www.gooddealgames.com/articles/Atari_800XLDJ.htm

Cheers, looks like im gonna have to.

What software you use? Sting or Mint?
Would I definately be able to access windows shared folders? And execute
from them?
Anything else worth noting?

Thanks, Dan.

Erm, you could have snipped that quote down to two lines, which would have made the whole post more understandable. It's hard to work out which bits of messages posters are commenting on or questioning otherwise?

Cheers

Derryck

Dan,

Well I don't know if Samba has been ported to MiNT yet (but it is very easy probably), to do windows file sharing stuff. But one method which will surely work is if you have an NFS server running on your PC. But yeah, Under STiNG when I had the right card, the STiNG drivers worked fine but I prefer the MagXnet drivers and Magxnet from ozk at http://assemsoft.atari.org as his drivers are MUCH MUCH MUCH faster because Magxnet is just better in general than STiNG, from an internal perspective rather than a user interface perspective. Put it this way, after I got the ethernec installed I never felt like I waited too long for a file download or upload - even mp3's ;-)

I dont' see samba available for download for mint which means there no smbclient to mount up the windows partitions as a mint drive but I suppose

I coudl start working on it.. It won't be hard but it would probably only work under MiNT.

Thanks
Mark

Normally I do, but surely u must know the perils of an ISP news server - the first 2 times i posted the message - both got lost in the middle of no-where.

It was longish i admit, but what use is an answer to others, if they dont know what the question was? -so i left it long.

>It's hard to work out which bits of
> messages posters are commenting on or questioning otherwise?

Look for the '>' markers

Other than that, sorry for the trouble - its not habit (correct if im wrong)

Dan.

Not that I know of :-)

Whereabouts in the UK are you BTW (email reply)?

Cheers

Derryck

HI,
i lost the cable connector btw case and keyboard on my atari mega st 4..where i can find schematics...or substitute?
It is similar like telephone pin cable..but who knows??
Could you help me??
Thanks

find a 6 wire RJ-11 telephone cord - it is perfect EXCEPT the mega st cable is literally reversed. If you plug the standard phone cord in you will FRY your keyboard.

Simply cut the cable in the center and turn it upside down and reconnect

for example here's 6 wires of 6 colors

```
R O Y B G V
R O Y B G V   - this is them after being snipped
```

now turn one of them upside down and reattach

```
R O Y B G V
V G B Y O R   - exactly reversed
```

I used this particular method to give myself a 10 meter keyboard cable.
Whatever works for you ;-)

Mark

I heard about mounting smb shares somehow in the MiNT list, IIRC. It was a
port of smbmount but under a different name, or something like that.

Anyway, coolest thing is to hook up the Atari on internet itself. Now I'd
just need a decent web browser and GEM IMAP mailer.

I have tried to install EasyMiNT recently and was shocked how easy it was
and how well it all went. Give it a try, you'll be excited.

Huh?

I just checked my TT and MST keyboard cables - they are both definitely straight-though, 1:1 connected. I even use a normal 6p phone cable for one of the keyboards.

Are you sure the cable is connected the right way on both your connectors? Sometimes, phone cables can be crimped in reverse, because the manufacturer did not care (it does not matter for phone use). However, this should be easy to spot when looking at the cable colors in the clear RJ connectors.

cu

I recently got ahold of a SCSI case which I would like to use with my Atari.

I have a link adapter on a printed board <the internal case ones> and I would like to utilise both my link and this new SCSI case.

Can someone maybe give me some help in doing this? Is it possible at all? How? I know I could do it with the ICD Link, but I don't have that and I'm not prepared to pay the money to go and get one - especially since ICD are giving people a hard time.

Thanks in advance:)

Darren

I previously posted regarding a problem with my Falcon's slow or hanging disk writing when using Screen Blaster II. I later discovered that this was happenning also in 256 colors without Screen Blaster (though not as often). In two colors, everything works fine. It was suggested that my clock buffer modification may be the problem, so I made another modification based on some other schematics (Line Audio), and I still have the same results. The problem occurs on large writes and deletes. Any suggestions as to what I should try next?

TIA

Dont we have another old slapper from that neck of the woods on the list.

If this new one pops along i'll have enough votes to make you treasurer, etc etc....

> URL in sig...

Click, click...

Ooh!, just a short trip around the M25, and near a railway station to boot,
no excuse to not visit!>

I got my Realtek 8019 card today - works fine, can ping, etc.

'Then' i found one of my other cards 'also' work now!!!
<kicks myself>

Anyway, for another card that'll work with EtherNec - its a Genius LAN 1222 card.

Is there anywhere that a list exists, or should we create one?

Dan.

Also found nothing initialises under multiTOS (2.06 rom in ram). Runs sweet under the built in 1.02 (i think its that) rom though.

Anyone got tips on using NVSRAM for replacement roms? I have a pair of 1MB NVSRAMS, 32pin - just a few pins need re-routing. Need to program somehow too :-) (anyone use a batronix programmer?)

Didn't realise it was that long! Bummer...

>> The ominous news is I've just been doing an M$ Office course (coz
>> I've been making it all up for the last few years)... There are
>> still so many parts of Windows that aren't a patch on Magic...
> Ive not found anything with Word and Access yet that i couldnt also
> do with Papyrus and texel.

That's impressive - especially seeing as neither is a database! I
could do loads, but everything would be work-related - I don't have
much call for any of that stuff at home.

>> The even-more-ominous news is that the order has finally gone in
>> for the PC (AMD2400+XP) so it looks like I'm in the home straight
>> with the TT B^<
> So i'll be getting a few more emails from you for a while then. 8~)

About one a month would be an imprrovement from me...

>> I think I'm going to have a stampede on my hands...
> That should be worth a bit.

The cost of my own software on the hard drive is frightening. The
stuff Gunter M left on there adds a bit, plus I still haven't got
round to installing the likes of Jinnee yet... then there's the
registered shareware...

> But before you part with it, use Papyrus to save all your important
> documents as RTF so that word will be able to read them

There's a thought! A fair amount's already portable, but I dunno what
I'm going to do with the outstanding Timeworks stuff (though a
heckovalot has to be redundant by now). I reckon I'll have to run
every program onthe machine to extract the personal data - that'll
take a couple of months!

Luckily, on CiX, I can upload ZIP'd files to my personal file area,
then download it again on the PC. I'm too lazy to port it physically
B^)

Not sure about this. Unless you're both on about the ICD Pro utilities
(which Cleanup was a part of IIRC) I think the driver software was
actually freely available. It was certainly downloadable and available
from PD libraries up to v6.3.xxx

Darren is the Link you are talking about the Link II. I have the
Link II in my STe sytem and it works fine. You need to get a SCSI
drive and put it into the case. Then you just need a cable go from
the drive to Link II and one that goes from the Link II to the ST.
It is a real simple hook up if you have all the cables. You can
buy them, but a friend built me the one that goes from the Link II
to the drive.

I wish that people that are no longer selling goods or services would at least take down their web sites that offer these goods or services. I have found almost a dozen Atari centric web sites with hardware/software listed, but when I ask for something, or worse, order through their online ordering system with paypal, I have received an email back saying they didn't have it (refunded my paypal transfer at least), or they wanted 4x the listed price (as was the case with one company in NY).

I'm not listing any names, as I don't think that would be professional.

So far, only two dealers in Atari wares (in the states) have earned my continued business: B & C Computervisions, and Bravo Sierra (no poblems on e-bay auctions either).

Ok, I'm done ranting for the evening.

While not very complicated, it is not -that- easy. Slot reserved for older TOS < 1.6 in the memory map (addresses $FC0000 to $FEFFFF) is too small for 256KB of TOS 1.6* and 2.0*; therefore, for those TOSses a new address range was reserved at $E00000 to $EFFFFF. The problem is- in the ST there is no address decoder for the new range, so you have to make your own- needing about two TTL chips beside the ROMs (EPROMs, NVSRAMs, whatever...) to create required chip select and data acqnowledge signals. And you can complicate things further if you want to keep the old ROMs as well (i.e. install a switch, and some switching logic).

And there -are- tips for installing two 1MBit EPROMs and the required address decoder. On the atari-related ftp sites look for a file named something like 206UP_20. There should be no significant difference for NVSRAMs, except if you intend to load (program) them in situ. Note that $E00000 address range is not physically write-protected; with the right hardware it is perfectly legal to write to that range- e.g. Lyndon Amsdon has used a pair of battery-backed static RAMs to load whatever TOS he wished.

I was wondering if someone might be able to help me figure this problem out. I have an Atari Falcon 030 which has had the left audio go out twice. The first time it went out, I spent $200 to have it fixed. They replaced some chip, I can't remember if it was the audio chip, or some kind of amplifier chip. It was very small, about a quarter inch square thing. (they sent it back in a plastic bag) Anyway, it worked fine for 2 years, then last night it went out again. No left audio, I tried everything, including turning up the gain, and using headphones. Nothing. Well this morning I try it, just to see if by some miracle it worked again, and it did! For 20 seconds. ;(Then I noticed, after it went out again, that if I turn the gain all the way up, I can barely hear intermittent crackling, especially when there is a loud bass beat playing. Anyway, what i am wondering is, could it really be a chip that is going out, or just some kind of capacitor. It's weird how the left audio sort of came back this morning. It seems like a fried chip would stay off. This sounds to me more like a capacitor, and if it is does anyone have any advice about how, or where to get it fixed, hopefully for less than $200? Thanks in advance for any help you can give me. -SaTcom2

Thats a problem with smd parts on mainboard upside/downside.
All what i had done to fit that is described, in german, on doitf030

> fixed. They replaced some chip, I can't remember if it was the audio
> chip, or some kind of amplifier chip. It was very small, about a

mostly it isn�t a chip problem. smd resistors / capacitors fault.

> quarter inch square thing. (they sent it back in a plastic bag)
> Anyway, it worked fine for 2 years, then last night it went out again.
> No left audio, I tried everything, including turning up the gain, and

Needs an signal tracer and time..

Hi,

I've got Atari 1040ST with only 2 (128kB) Roms. First, I program eeproms
with TOS 1.04 rewired pins. Computer starts normally. Then I start to build
decoder circuit (with 74138, 7408, 74244), reprogram eeproms with TOS 2.06
(Super TOS). And now when I start computer I've got Black square insted of
Atari sign, then I see three bombs and computer is restarting. After about 1
min. of restarting i see 4 bombs insted of 3. When I reeprogram eeproms with
TOS 1.04 everything is ok (without removing decoder).
Can you tell me what to do now??
I tried to:
- delay DTACK signal,
- conect to DTACK bus via tranzistor insted of  74244
- i tested decoder - works fine.

--
Thanks,
Marcin.

> Can you tell me what to do now??

What sized eeproms are you programming TOS 2.06 to? they must be 1Mbit
(eeprom would be 28x010 - x being eeprom type, C for cmos)

If your programming 2Mbit roms, try mirroring the EVEN to both halves of the same eeprom and same on the other eeprom.

BTW, you are programming one eep with EVEN bits and the other ODD bits (you must be, or 1.04 wouldnt work).

You tried swapping the eep's round when you did the 2.06? It (unlikely though) could have programmed even in the odd and odd on even, and the ST is reading backward data.

Just a thought, i still have my *prom programmer in final build stages
missing a 74HC157 (damn you Maplin!! end of range indeed :-( )
And two 1Mbit NVSRAM's to try in the ST (and two smaller ones for my zx spectrum +3, gonna upgrade to allow HDrive access :-P)

Dan.

>for any help you can give me. -SaTcom2

This sounds to me like it could be a dry solder joint. Can be difficult to find, specially with surface-mounted devices. A freezer spray can help sometimes.

Another possibility is a dying electrolytic capacitor. Really needs a way of tracing the sound signal to locate.

Regards, /Peter/

>- i tested decoder - works fine.

Several points come to mind:

* TOS image in EPROMs may not be correct. To me this seems a probable cause because your handicraft appears -almost- to work, i.e. you have -something- where Atari logo should be, you also have bombs appearing. I faintily remember that once I tried using "SuperTOS" (i.e. TOS with some extensive patches?) but without success. You should have no trouble finding other TOS 2.06 images on the 'net (several language variants). Perhaps you should try another image.

* TOS image, even though basically correct, may not be relocated to proper starting address ($E00000). If you use a pathced TOS there is a perhaps possibility that someone has not properly adjusted everything for the right address. I would like to point to a very useful "TOSPATCH" utility, which, starting from the image of a German TOS 2.06 can produce a modified and relocated image with very useful changes, including changes/translation of internal RSC files. This I have tried personally and it worked.

* EPROMS may not be of the correct type- some manufacturers, for some reason unknown to me, produce 1MBit EPROMS with functions of two pins swapped: instead of A16 on pin 2 and -OE on pin 24, with those chips it is A16 on pin 24 and -OE on pin 2: Fujitsu 27C1000, Toshiba 27C1001, NEC 27C1000. Confusingly, the same manufactorers also produce EPROMs with correct pinouts: Toshiba 27C1000, NEC 27C1001. Note the opposing designations on Toshiba and NEC chips!!!

* EPROMS should be fast enough- but it is not likely that you were unlucky enough to use too slow ones- I used 170ns EPROMs and they work OK. Some docs say that 150ns or faster should be used, especially if you consider adding some CPU accelerator later on.

* Did you disable/remove old ROMs (or at least -ROM2 signal) before using the new ones, in order to avoid bus conflict?

* Hopefully you did not use 74XXX chips but used 74LSXXX, 74HCTXXX or 74FXXX, because of shorter delays and lower power consumption.

* There s no point in delaying -DTACK. It should work as it is, CPU's internal timing taking care of everything.

* Using the large and power-hungry 74XX244 chip for just one signal seems a waste. Basically, any non-inverting open-collector-output chip would do. Note that 74XX08, too, is not completely used in that schematics. You in fact need only the one AND gate which produces -CE signal, buffering of two address lines does not have any purpose; you could use a chip with open-collector-output AND gates, with a pull-up resistor for -CE (resistor should have low enough value for faster response- not more than 2-3kOhm),

and use a spare gate to produce open-collector -DTACK.

* There may be, after all, some wiring error in connecting he decoder and new EPROMs, or a soldering error (two signals connected where they shouldn't be).

>When I reeprogram eeproms with
>TOS 1.04 everything is ok (without removing decoder).

I don't quite understand this bit- Originally, TOS 1.4 has different starting address than TOS 2.06, so they should not both be able to work activated by the same address decoder?

Hi,

A while ago I rescued a 260ST and a 520ST from the trash, complete with PSU's and the 360KB external floppy drives. Problem is the TOS disks are missing.

Does anyone out there have a copy of the TOS boot disk that came with these machines, UK or US? I don't think sharing this with me would be considered breach of copyright, I would imagine that since I have the machines, having a copy of TOS 1.00 would be legal (I'm not into piracy)

Another thing I'm looking for is the original Atari drivers for the Viking board and SM194 monitor. Once again, I have the hardware but not the drivers. I tried Ralf Zimmerman's version but it just bombs out, I'm not sure if it's the driver or maybe the board is fried, so I'd like to give it a try with the original drivers.

TIA and regards,
JM

That's curious, the usual places on the net don't have them anymore.
I wonder what happened?

I have an STe, so 1.62 is all that's available here.  The 1.00 disk
version is different enough I don't know if you can use it.

I'm in the UK, in Kent, let me know if it doesn't appear in time.

Hey,

Sorry for more questions:

As i mentioned in my previous posts, I have gotten my EtherNec up and running nicely. (On my 1040STFM with 4MB ram, RTL8019AS NIC, 2 floppy DD's and gaussed mono monitor - black/white/purple)

I can ping addresses and sites with success (domain lookup working fine).

Im running all with STinG at the moment, but I found using BNet with STinG bombs, rebooting the system.

Also trying to use AtarIRC gives me the error
'tcp_open(irc.quakenet.eu.org)=Destination host is unreachable.

quakenet being used to test. Its reachable/usable on my PC.
Plus i can ping quakenet from the Atari.

So any suggestions to get a system to access a PC (windows) share drive,
(map it as a harddrive on the ST?)

Mark D suggested assemsoft web site, but i couldnt see what i was looking at - is any of the stuff there compatible with STFM and RTL8019AS network card?

Would MagiCNet be a safer bet for this or Mint? - Im just--- Lost. :-)

Thanks

Dan.

The only way to do this is with MintNet and I don't think this will fit on
two floppies.
Even then it won't let yiou run programs, only store data.

> Would MagiCNet be a safer bet for this or Mint? - Im just--- Lost. :-)
>
>

Possibly, I have never tried it. I tend to run the FTP server on my ST and
then move files to its hard drive using a FTP GUI based client on the PC.

Bonjour :)

> Im running all with STinG at the moment, but I found using BNet with STinG
> bombs, rebooting the system.

I use EtherNEC, STinG, BNet, under MagiC on my MegaST4 and Falcon and it's reliable.
The source GFA of DGEM is written and compiled on the MegaST, and transfered the PRG to the Falcon for the tests. Never saw a corrupted file.
Floppy disk or Iomega ZIP100 transfers were used, but now abandonned : I only have now to drag'n'drop the files in Magxdesk :)

I tried to use BNet on MonoTOS, but it crashes the file or the system.

Bye

It will only work in an Atari or a Amiga NOT a PC. In an Atari or Amiga no drivers are needed.

It sounds like you have one of the ADSCSI cards from ICD. This was the internal version that came out before the Link. IT should say Advantage Plus or something like that on it and have the ICD logo. It also has two DMA plugs on the one side and an internal type SCSI connector on the other. You could mount this card in your external SCSI case and then use a DMA cable from the back of the Atari to the in side of the card.

If you don't have room in your case for the card you could build a case for the card. It would need a power supply and an external type SCSI connector to allow you to run a cable to the other SCSI case. It's do-able but would be a bit of a pain to do.

Make sure you get information about the correct way to hook up power to the card before you power it up!

I seem to remember that the maximum voltage for the card is 5 Volts. (Can anyone confirm this and clarify the pin-outs?)

The connector on the ADSCSI card looks EXACTLY like the connector on floppy drives, and floppy drives use two voltages (+5V and +12V) to make them work, so don't just plug the card into a PC power supply because you'll fry it.

Hope this helps!

```

Hello,

In order to get BNet work on your system, do you have to be
running it on both computers or does it need to be running on just
one of them. I am trying to get my STe and Hades to use BNet using
the EtherNet connection. I am running BNet on the Hades and am
trying to get the STe's partitions to come up. So far no luck. I
think I need to modify the route.tab file on the STe. The Hades
is using MagicNet and the STe is using STing.

>bombs, rebooting the system.

You are running STing under place TOS and do you have the STING
version of BNet? What drive do you have as the drive BNET is
suppose to use? Cannot be past "P" in the alphabet if you are
using it under regular TOS and it must not be used by another
partition .

>Also trying to use AtarIRC gives me the error
>'tcp_open(irc.quakenet.eu.org)=Destination host is unreachable.

Look at your HOSTNAME in the default config file in the Sting
folder. I got the same thing until I changed it. I use AT&T and
needed to change the hostname to "attbi" as my email address is
edbaizjr@attbi.com

>So any suggestions to get a system to access a PC (windows) share drive,
>(map it as a harddrive on the ST?)

Well is you can get BNet to work, I heard Samba will soon be
modified to use BNet so this can happen. I too am trying to get
BNet to work with my Hades and STe.

>Would MagiCNet be a safer bet for this or Mint? - Im just--- Lost. :-)

I use MagicNet and Mintnet on my Hades. Both work well... MagicNet
and the MagicNet version of BNet work find on my Hades.

Hi all,

I was given Atary 1040 ST computer. It does not have mouse. It does not have documentation... I am very good in PC (professional) but I never had Atary... That is like a new toy for me :-) Very interesting one. I want to make it work. I want to study how it works... But I faild to fined in internet and download any documentation about that computer. Can anybody help me where I can find out it?

Best regards,
Konstantin Tchebotarev

I don't know your question directly, but I thought I would point out, the biggest problem I have had with some old floppy drives is with the drive belt, it's basically just a rubber band and it losses its stretch and "grippiness" as it gets old.

A new drive belt cost about $2 and was pretty easy to install when I did it.

Correct on the board only using 5v. You can use a floppy power cable, just remove the 12v yellow wire from the plug.

The plug is wired as follows:
5v G G 5v

You can get the basic software from ICD's web site, but don't expect CD support or any of the advanced tools.

I have successfully used newer 1.44M floppy drives in my 1040 and on an
external drive board from a SF354. Never had a problem with my older
disks or copy protected games.

Hi folks,

I have a HP LaserJet 1200 printer for daily use. Is it possible to use it with my Falcon as well? I'd need a textonly driver and probably hardcopy driver for singletasking TOS and probably a VDI/GDOS based driver for MagiC use.
Is there such tool available somewhere?

cheers,
Matthias

A good place to start might be the Atari Hyperlink Launchpad (http://www.geocities.com/SiliconValley/Bay/8745/), although the site is no longer maintaied it does have a collection of useful software as well as links the Quick Faq and TOS 2.06 user guide, even if you do not have TOS 2.06 fitted to your machine most of the user guide will be relevent as most of the menus/menu functions will be the same. Notable differences may be the lack of the Atari Logo and Memory check

at boot up, no Icon resource file and and the lack of the Newdesk
Desktop which means that you can not place program icons on the
desktop and that the Desktop save file will be called Desktop.Inf not
Newdesk.Inf.
If your interested more in the technical side you can probably find
circuit diagrams for your machine at
http://www.fortunecity.com/skyscraper/quadra/455
In any event you will need some Double Sided Double Density 720K
Floppy Disks (unless you machine was upgraded) you could try 16/32
systems in the UK (
http://www.1632-sales.zenwebhosting.com/acatalog/) or B&C in the
USA(http://www.myatari.com/) though I'm sure a web search/ the
launch pad site will provide other outlets.
Placing a blank floppy (or one not containg an autoloading program) in
pre TOS 2.xx machine will make it boot to the desk top much faster
than using no disk.

I use a LJ-4plus on both my Falcon and TT, under plain TOS as well as under
MagiC. Why couldn't you use your LJ-1200 ?
At least, you could start with LJ-II drivers, if the one for the 1200
doesn't exist.

PCL as used by hp LaserJet printers, is backwards compatible with all older
versions.
There's no reason you couldn't use LaserJet II drivers. LaserJet 4 drivers
would be better, because they're atleast 600dpi. unless someone writes a
driver for it, it'll never see its native 1200dpi. unless your just sending
plain text, which wouldn't matter anyway, because then it would use its own
fonts and run at 1200dpi.

I used my LaserJet 5L with my MegaSTE and Papyrus, with this you can write
your own driver file if you have the details.

Does anyone know what type of settings to use to make a CD of a bunch
of Atari image files on a PC that will be readable by an Atari ST?
I've had a bunch of answers from a previous post about Atari CD

creation programs but need to try and create the CD on the PC and make
it readable on the ATari

Stick to ISO9660 and it will be readable on an ST or any other platform for that matter.

There is a program for the Atari called CDiso which will create a
CD with the familar ISO format. This format is readable on any CD
player. I have created many CD's with this program and they are
readable on any PC, Mac or Atari. There has to be a program for
the PC that will create a CD in this format. This is the kind of
program you need.

I have Service manuals for the 520ST, the SC1224 color monitor and the SF314
floppy drive.
All are complete and in good condition, some are photocopies (they came that
way).
I would consider any reasonable offer for any or all of the above.

EZCD Creator, Neros, and NTI CD-Maker will all make CDs that are readable on an Atari. Just stick to the ISO 9660 spec and it should work.

With Neros and CD-Maker[0], you can choose to store the files with long filenames, or stick to 8+3 format. Ordinary TOS will see the standard 8+3 filenames but Magic does, and MINT should, see the long names.

[0] No idea about EZCD capabilities. The copy that came with my first writer (v4) won't run under XP, and the other writers I've had came with Neros.

Regards,
  David Bolt

A normal "data" CD made by any PC CD creation programs shoudl work but on the Atari you'll need Extendos or Spin to read ISO9660 cd's.

Greetings!

My STacy has an Atari host adaptor (C103561-001 REV 2) plugged onto the mother board, and a very small 20meg Conner hard drive that I'd very much like to replace with something bigger. What I'd like to know is...

How many SCSI devices can be used with this host?

Will an 'internal' 50 pin Zip or Jaz drive work?

Is there any possibility at all that this host can be used with HDDriver's SCSIDRV routines for driving an ethernet device (Dynalink w/STing driver).

Any tid bits about the host would be very welcome...
I.E. if it can/can't support parity, does it supply 5v term power, etc...
What do the three little dip switches do?

Thanks,
Brian

Only one, as far as I know.

> Will an 'internal' 50 pin Zip or Jaz drive work?

It should work as a ZIP or JAZ is not different from any other SCSI drive.

> Is there any possibility at all that this host can be used with HDDriver's SCSIDRV routines for driving an ethernet device (Dynalink w/STing driver).

Does the Dynalink require initiator identification or parity information? If it does it will not work.
I'm not sure, but I think the Stacy's host adapter is very similar to the one in the MegaSTE. If this is the case it only supports one SCSI drive up to 1 GB, no parity, no initiator identification.

Actually it seems it can handle two SCSI devices and both at SCSI id 0!
Check out http://atari.nvg.org/scsihost/index.html .

There is also a parity generator on the site at
http://atari.nvg.org/parity/parity_gen.html that should make it possible
to use a device that needs parity to work.

The initiator identification is another story, though.

Thanks for the help. I have most of the first club's disks (300
shareware disks) copied into ST format using WDFcopy and now I am
going to start working on the disks from the other club. I will
problaby put STEEM on the disk also so people can try runnning the
disks on their PCs or the old Ataris.

Dave

Hi... I have my PC at uni, which is very far away in the wilds of
Scotland, whilst I sometimes pop back home to south east england to
see friends/family etc.   I have an aging 1MB STFM sitting back there,
that I sometimes use to type up work if need be (using Protext
4.3...). Having not followed the state of atari that much as of the
past few years; is it possible for me to access a pop3 and or
web-based email account (ie hotmail), using my atari? I don't need to
access attachments, but the ability to send and receive email whilst
connected to a PPP connection would be great; as would telnet / simple
web access - again this doesn't even have to be proper graphical HTML,
a unix style lynx browser would be fine. At home i'd have a standard

BT Internet PPP dialup connection, and my atari ST has 2 double sided
floppy drives, and a standard external modem... Anyone got it to work
with a spec like this?

Cheers,

Dave.

POP3, news and web browsing should be OK, but TBH I think you'd be
struggling with the latter.

You'll need HSMODEM and STinG or STiK for your Auto folder, and NEWSie is a
combined email and news client with some very rudimentary web browsing built
in. I've never tried web-based email on an Atari, but I doubt that it will
work.

Cheers

Derryck

Dear M68k users

A problem with the 68k CPUs is that they top-out in speed terms at a 60MHz 68060 (including FPU and MMU). An Internet group called opencores.org develops chips, i.e. free hardware as apposed to free software. Their website has a section called Wishlist where users can

suggest new ideas. As they have designed CPUs in the past, I have suggested they design a faster 68k compatible processor (binary compatible unlike Coldfire). Ideas that show enough support by votes get made. So please could you spend a few moments trying to make faster 68k processors a reality by voting on http://www.opencores.org/wishlist ,this a large webpage, so you need to search for '680x0'. Thanks in advance.

Yes it is possible, but more memory (2 or 4meg) would be better. I
would go with STiK2 or STing and use Newsie. It allows email, ftp,
newgroup access and even has a text-based web browser.

It is possible. You won't likely be able to access web based mail due
to the ST's inabiltity to easily deal with security (i.e. encryption).
 However, POP3 over PPP is possible. You will need STing or STiK and
an email program (Marijuana Mail is the smallest and probably the only
one you can get running on a single floppy 1 MB ST). Since you have
two floppy drives, you might prefer Newsie, which has very good
(though slightly buggy) newsgroup capability and Lynx-like HTML
capability.

I got it going after shorting both E6 AND E7. Still not sure about the
parity though.

Has anyone used 30pin simms to upgrade the ST memory on the TT? Ive been looking at it and it seems it could be done on the mother board. I only decided to look at this after looking at the price of the DRAMS needed to upgrade the motherboard.

Straight Fax is probably the best program for the Atari ST. You
can try at the sites below to see if they have it for sale:

Hello,

I am unsure if these ngs are the right place to ask, but here goes. (If not, can you point me to where I should ask?)

I have a version of Trip-a-Tron by Jeff Minter, but I do not have the manual. I was wondering if anybody has the manual on their PC, and could send it to me, or maybe they can point me in the right direction. Also, does anyone know Jeff Minter's email address?

Thank you very much,

Peter

The following keyboard repair info was originated by Mario Becroft, but has since disappeared from the net. With Mario's permission, I'm posting it for posterity :-). The usual disclaimers apply.

========================== snip ================================

This is a copy of Mario Becroft's instructions for Keyboard Repair of the Atari TT mylar, 1997.

These instructions may also apply to other Atari computers: no guarantees or warranties are claimed: following these intructions does not guarantee anything: all who follow them do so at their own responsibility, with no recourse to Mario Becroft or his copyists.

The following was downloaded from the site of Funkeyware.org and printed out for safe-keeping: just as well, as my TT needed repair, which I carried out successfully. It is now typed out by Charles Stanley, cstanley@zetnet.co.uk, since all online copies seem to have disappeared.

Mario Becroft has kindly given permission for this to be reposted; his email and web addresses have been updated and are correct as of February 2003.

<BEGIN>

TT_KEYBD.ASC : copyright (c) Mario Becroft 1997.

FUNKEYWARE.ORG - TT_KEYBD.TXT - 11.07.1997.

NOTE: The following text explains how to fix a defect that plagues both Mega STe and TT keyboards alike, making the CONTROL key inoperative.

Preventive maintenance on keyboards not yet affected should also be performed. This involves opening your keyboard as explained below and sticking a length of insulating tape over sensitive areas, to prevent the mylar from eventual damage. While every precaution has been taken to ensure accuracy of information, neither Mario Becroft nor Funkeyware offer any guarantee about the results.

ATTEMPT AT YOUR OWN RISK!!!

Date: Fri, 27 June 1997 11:13:22 +0000
From: Mario Becroft mb@tos.pl.net
To: q-funk@megacom.net

DISCLAIMER

While I believe that the repair described in this document is reliable when carried out correctly, and while I have made every effort to ensure that this document is accurate, I can offer no guarantee with regards to the repair, nor your workmanship in completing the repair. I am confident that the repair will work, if completed with reasonable care, but I cannot guarantee this. CARRY OUT THIS REPAIR AT YOUR OWN RISK! If you do not think you are able to complete the repair, I advise you NOT to attempt it.

THE REPAIR

A common problem with TT (and presumably M-STE) keyboards relates to the control key. After a period of time, the control key will cease to operate. This problem happens because an edge in the internal keyboard casing rubs on the keyboard mylar and eventually rubs through the track that connects to the control key. This problem does not appear to affect any other keys.

If the problem has not yet occurred, it may be advisable to take preventive action. Although I have not tried this, I suspect that by either putting a protective covering of some kind over the track, or by carefully filing away slightly the plastic casing in the affected area, the problem could be avoided.

If the problem has already occurred, fixing the problem requires rejoining the broken track. The method decribed below has been used on a number of TT keyboards and, provided it is done with care, seems to have a very good successs rate. Every keyboard that I have repaired in this way has worked flawlessly ever since.

You will probably be able to complete the repair in an hour or so. Be sure to read the instructions completely before carrying them out so that you are familiar with the repair. Take it slowly and exercise care in completing the repair.

First the keyboard must be disassembled. The removal of the three screws that are present underneath the keyboard will allow the outer casing to be removed. It is then necessary to disconnect an earthing wire by unscrewing the connector, and it would be advisable to unplug the two ribbon cables joining the keyboard unit itself to the PCB.

At this point you should have the black plastic keyboard case with metal backing completely disconnected from the keyboard casing and PCB. You can now proceed to removing the metal backing from the keyboard. The backing is attached by a great number of clips: each of these clips must be carefully opened. An easy way of accomplishing this is to work from one side to the other, until the backing is disconnected from all the clips.

You should now observe the keyboard mylar, which can be removed from the keyboard. The mylar is where the problem lies, so the rest of the keyboard can be set aside while you work on the mylar.

Looking at the mylar from the top, you will observe a track at the far upper left hand corner that connects to the control key. The upper left hand corner portion of this track is where the problem lies. The break may not be visible at first but, by careful observation, a rough breakage in the track should become apparent. Fixing the keyboard requires rejoining the track at this point.

EXTREME CARE is required in carrying out the next steps, particularly when punching the holes in the track. Read throught the next steps carefully before you start so that you are familiar with what you are doing. Take it slowly and carefully, and the operation will most likely be a success.

Examine the area around the breakage. You will be punching three holes in the track, evenly spaced approximately 5 mm apart on either side of the breakage. These holes need to be EXACTLY IN THE CENTRE of the track and must be VERY SMALL. You will need a needle with fine point (such as a sewing needle) to make these holes. A single strand from a multi-strand wire will be later threaded through the holes, and the wire must fit firmly, not loosely, in the holes. Therefore the holes must be very small.

Working out from the breakage, and with the aid of the needle and a magnifying glass, VERY CAREFULLY make three holes on either side of the breakage, evenly spaced approximately 5 mm apart. Ensure that the holes are EXACTLY IN THE CENTRE of the track and VERY SMALL. Make the holes one by one, and check that each hole is the right size before you make the next hole. Check the size by attempting to thread a single strand from a multistrand wire through the hole. The strand should fit firmly in the hole. Remember, there is no going back once you have made the holes, so ensure that you make them very carefully and accurately.

Now that the holes are complete, it is time to thread a single strand from a multistrand wire though all of the holes. Get a piece of multistrand wire and extract from it a single strand, long enough to cover the length of all the holes you have made in the mylar, with substantial length to spare. Carefully thread the wire through the holes one by one, pulling the wire tight after each hole. Leave a short length (a few mm) protruding from the first hole. The wire should fit firmly in the holes, and it will require care to thread the wire through the holes because of this firmness. The wire should be threaded alternately up and down through the holes so that it joins the track where the breakage is. When you have finished, cut off the ends of the wire so that a few mm of wire is left protruding from the end holes. Pull these ends tight and push them flat against the mylar.

The most difficult part of the repair is now complete. It is still necessary, however, to finish the repair properly. If the wire you have added makes electrical contact with the metal backing that attaches to the keyboard, the keyboard will not work. For this reason, it is necessary to place insulating tape between the wire and the metal keyboard backing. It is also important that the wire does not touch any other tracks on the mylar, or obstruct the passage of any keys.

Once you have ensured that everything is as it should be, it is time to reassemble the keyboard and try it out. Reassembly is generally the reverse of disassembly. Reattach the metal backing (which is much easier than detaching it), then reconnect the two ribbon cables and the earthing wire. Do not entirely reassemble the keyboard; instead, plug it in in its partially assembled state and test it. Check that ALL the keys work. In particular, check that the control key works. Check that random characters are not sent when the control key is pressed. If all is well, you can finish reassembly of the keyboard - you have finished. Congratulations!

If there was a problem, then check, first of all, that the two ribbons are correctly and fully in their sockets; and ensure that the metal backing on the keyboard is fully attached, with all the clips attached correctly. If it still does not work, determine the symptoms of the problem and refer to the following list of possible causes:

* The control key does not work, but everything else it fine.

This means that the repair has had no effect. Remember that the wire must join the two sides of the break in the track.

The holes should be either side of the break, and the wires should join the break. Check that the wire fits firmly in the holes and that the holes are exactly in the centre of the track. If the wire is not contacting properly, it may be necessary to remove the wire, add more holes and then get a longer wire and thread it through again.

* The control key does/does not work, but various other keys no longer work either.

This could happen because you have inadvertently damaged other tracks on the mylar while attempting the repair. If this is the case, you could try repairing those other tracks as well, although it might end up easier to just buy a new mylar.

This may also happen because one of the ribbon cables is not inserted correctly and fully in its socket.

* The control key causes random characters when pressed.

This happens when the wire you added is making electrical contact with the metal keyboard backing. Ensure that insulating material is present between the wire and the backing so that electrical contact cannot occur.

CONCLUSION

If you have carried out the repair, chances are you now have a working control key. Congratulations!

If, however, the repair was unsuccessful, you may attempt to rectify the fault yourself. Provided you carried out the repair as described, I do not believe there is much that can go wrong.

I do not want to receive huge amounts of email from people who have problems with this repair. You carry out the repair at your own risk. If you do need to contact me for some reason, however, my email address is given at the bottom of this document.

Good luck!

The backing is attached by a great number of clips: each of these clips
> must be carefully opened. An easy way of accomplishing this is to work
> from one side to the other, until the backing is disconnected from all
> the clips.

These clips brake off real EASY as I know all to well, that's why my KB has been dead for 3 years now. And once broken there's no way to fix them either.

Hello.

If the risks and description of how to repair your TT mylar puts you off attempting it I still have new Mega STE keyboards for sale. You can take the innards out and rebuild into your TT case or just use it as is.

Current UK price is �10 sterling plus post. Total for US customers inc shipping is $40 US.

Hello,

Noone using STarCall http://www.icc-computer.de/starcall ?
It's still maintained, and Ingo Linkweiler is very serious! I
had problems when attempting to run it under Magic 6.2, and he
fixed it in a very short time! And, last but not least, it exists
in at least 3 languages : German, French and English!

Have a nice evening,

J.-Luc

Hi. I recently aquired a Mega STe with an extremely noisy internal drive. This seems to be a standard unterminated SCSI drive. Can I simply replace the hard drive with a newer SCSI disk? If so, what is the largest drive size supported?
I've also been told that this computer will accept 4MB SIMMs, but all the documentation I've found mentions only 1MB SIMMs. Will 4MB modules work?

Thanks very much,
Doc Shipley

With the internal host adapter of the MegaSTE the maximum size is 1 GB.
With another host adapter (e.g.) the LINK97 and a decent hard disk
driver there is no size limit. Note that AHDI cannot access more than 1
GB of a SCSI drive.

OK, thanks. Does this mean that the adapter will only access 1GB of a
larger drive, or that a larger drive won't work at all? And will a
generic SCSI disk work?

Yes, it will only acces 1 GB. Note, however, that a lot of current
drives require the host adapter to provide parity information and
probably an SCSI ID of its own. Such a drive will not work with the
MegaSTE's internal host adapter.
In general any generic SCSI drive will work (regardless whether it is
SCSI-2 or SCSI-3), but remember the parity/SCSI ID issue above.

IIRC as with the ST the MMU can only address a maximin of 4MB RAM,
SIMMs were used in the STE (as opposed to PCB mounted chips) to make
memory upgrading easier and so memory expansion beyong 4MB would
require an expansion board containg a second MMU.
I believe the following configurations are possible on an STe 4 x 256K

SIMM = 1MB, 2 x 1MB SIMM = 2 MB (fitted in one bank only, usually 0)
and 4 x 1MB SIMM = 4MB.

I believe but am not certain that it's possible to use 4MB SIMMS, but only 1MB of each SIMM will be seen by the system.

The Magnum memory expansion board comes to mind - you could add some serious amounts of memory (relatively speaking).

Cheers

Another possiibility is to remove some of the plastic on the case in the fan
opening which partially obstructs the airflow.  I removed alternate strips of
plastic on my TT and it helped (it should also improve cooling).  A sharp hobby
knife (and some care :-)) is all that's needed.

  Yes, it's got that "marble in the roulette wheel" noise going on.
Plus, the top of the case over the drive gets noticeably warm after 20
minutes or so.  I'm reasonably sure that's A Bad Thing.  I've got everything
backed up to floppy from the disk, but I want to replace it _before_ it lets
out the magic smoke.

  Thanks for all the help.  Any pointers as to formatting the new disk?
This is the first Atari I've had with a 1.44MB floppy, much less a hard
disk.  :)

>Perhaps small fans make a lot of noise, period....

You might add the word "cheap" to that, a few bob spent on a decent fan might be just as effective - or try a 47R or so resistor in series with the present fan to slow it down a little.

Cheers

Derryck

That depends where the noise is coming from! If it *is* the drive,
as you originally suspected, then its noise will get out easier
with some of the fan ribs cut away.

In any case, if the fan is accessible from the outside of the
case, just stick a pencil in it to stop it turning (safest to do
it before switch-on, but I doubt it would hurt to do this when
it's running either). If the noise drops appreciably, it's time to
replace the fan. If not - replace the drive :-)

Regards, /Peter/

I need some help recovering my data from an old Microscience HH-1050 40M drive. I haven't used my system in several years, due to lack of space, and have recently purchased a new drive system from Ben Smith (thanks, Ben).

I'd like to recover the data, but I think that my adaptec 4070 controller is flaking out. Most of the time, the ICD controller won't see it on the bus, and when it does, it won't detect the drive. I've found the specs to change drive ID's, and that isn't the problem.

Anyone know where I can get another controller, even as a loaner? I just want to get the stuff off of this drive, and onto the new drives I just got.

Tobin

Were going to have to do something about this mail lag of yours, 8~)
sometimes you don't answer for 6 months or so. I only asked as i was looking
for things to keep me occupied, no matter, I've got to go on the job hunting
wagon again from the 7th of march, Doctor has signed me off the fruitcake
list!!...

Dear Atari gurus,

A kind collegue of mine donated a Atari 1040STF with a Megafile 44, the latter without a hard disk. I succeeded in getting a 30 MB standard SCSI hard disk to work with the computer, but I would like to use a bigger disk, so that I can install Linux on it. Is there a limit in disk size, or can I use just use a disk of any size?
Thanks in advance for your answer!

Matthieu

I am experimenting with expanding my FreeMint installation using RPM.

I decided to install "man" so that I can read some of the docs that come with various unix packages.

Using RPM it told me that there were other dependancies: groff, less and ncurses (whatever they are). So I patiently installed all those as well using RPM. So far so good.

When I start the console shell cli and type man it says "Command not found".

RPM has installed man in the usr/bin folder. If I run it by double-clicking it starts ok.

Where does the shell expect to find the man program ? How can I check where it is looking ? Why do the executables get scattered around so much ?

Regards,

Peter

It might just be a matter of adding and extra path to your your MINT.CNF
line that starts with setenv PATH=.
I know when I tweaked my system for RPM stuff I had to add some paths
for the shell to look in.

Hi Steve,

>> There are some English files for CBHD in the Misc section of my web
>> site if you woulld like to try them.

That's a message from the Dark Ages! :-)

>Your website also mentions a club near to me, could i have some more details
>please?.

Sure, the Cheshunt Computer Club meets every month, it's what every Atari owner within reach of Cheshunt needs. Cheshunt itself is near J25 of the M25 in Herts, and everyone is sure of a warm welcome!

The web site URL is in my sig ;-)

Cheers

Derryck

You can't install Linux on a vanilla STF, at least not any recent release.
The STF does not have virtual memory capability as required by LINUX.

>
> Matthieu
>

P.S. You should be able to install larger disks. In practise you need a disk

that does not need Initiator ID or Parity.
I have not managed to get a disk larger than 1Gig to work with my BBDP adaptor....

Thank You Mark. Google has an overwhelming amount of info. I get on the Net with my Atari and sometimes google is overwhelming. Couldn't you just tell me about it?

==Thanx==
===Ben===

Inside 2 of my Mega 2's are the ICD AdSCSI Micro Controllers.   These are 50 pin scsi converters.   Does anyone know how large of a drive I can use on these?

Also, I have the Adspeed ST 16 mhz accelerators in them. I don't have any docs for this equipment, anyone know where I might find them?

Thanks

The drive size will be limited by the driver software you are using; with HDDRIVER there is essentially no limit. However, the ICD controllers do not support SCSI arbitration, so you will need to find a drive that does not require it. In practice, this will probably limit you to 1GB drives, since most (all?) drives larger than that seem to require arbitration.

Roger

Hi there, I usually use Google to read the comp.sys atari newsgroup.
So I didn't mean to do a universal search of the web for the info. But
if you search just in the comp.sys.atari.st  newsgroup there seem to
be a lot of posts relating to the Barracuda. Also check a site called
A to Z cables for info on SCSi in general. I have a Barracuda as well
and I can't get it to work, but others have. Good Luck.

I suspected a PATH problem but the PATH I have is huge (well I think it is)
and seems to point to just about everything:

```
setenv PATH .;c:\n_aes;c:\n_aes\apps;c:\mint;/bin;/usr/ucb;/usr/etc;
            /usr/bin;/usr/sbin/;/sbin/;/boot/mint/bin;/usr/local/bin;/m_tos
```

It always reminds me of DOS (yuk). Is it ok to mix TOS and unix format paths ?

Regards,

Peter

Good question.  I think mint can deal with both.

I posted a message a while ago to this newsgroup, but for some reason I cannot reply to the thread to clear up something (am I just missing something fundamental about newsgroups in general there?)

I have only following for sale:

Atari 520ST - external drive, PSU & TV lead/dongle, some disks, and some other bits.

Atari 1040 STF

The Atari monitor/STE/Falcon are NOT for sale!! Just wanted to clear that up, thanks.

Oh, and I am in the UK. And I still need to find a box big enough for posting an ST - they're too wide, dammit!
No original boxes I'm afraid...

You could try Best Electronic or B&C Computers. Have you tried a
different driver like HDDriver and see if it reads it?

I found one at B&C.  Should be here next week.

I've also tried ordering the ICD Hard drive utility suite, but was told by
ICD sales that they no longer support Atari.  The HDDriver doesn't see the
partition tables either.  I suspect the controller, as it won't format a
spare TM502 either.

Does it require the software to run? It appears that these Mega2's boot an ICD driver of some sort when it powers up. I know that the ICD hard drive software runs first as these machines have the ad SCSI Micro installed.
Thats another question, do these internal hard drives need the ICD driver to run with that hardware or does the ST see the drive through the hardware without it?

Sooooo many questions, absolutely no docs here.

Thanks

It's not that bad. I assume that there are a lot large drives that do
not require initiator identification, in particular those with an 8 bit
SCSI bus. I guess, however, that in increasing number of new drives
requires initiator identification.

The only thing an Atari can do without a hard disk driver installed is reading the first sector (root sector) of the drive and executing the bootstrap program (if any) installed on this sector, which usually loads the hard disk driver. For everything else a driver is required.

Hi all,

I've just sourced a Dallas DS12887 NVRAM chip as a replacement in a Falcon
with a dead battery. Just checking that this will be suitable, and whether
there's anything other than "just solder it in" that needs doing?

Cheers

Derryck

Compatible:

MK48T87B-24 (Signetics)
MCCS146818 BM (Motorola)
MC146818A (Motorola)
DS12887 /DS12887A (Dallas)

Description DS12887 / DS12887A

The DS12887 Real Time Clock plus RAM is designed to be a direct replacment for the DS1287. The DS12887 is indentical in form, fit and function to the DS1287, and has an additional 64 bytes of general purpose RAM. Access to this additional RAM space is determined by the logic level presented on AD6 during the address portion of an access cycle. A lithium energie source, quarz crystal, an write-protection circurity are contained within a 24-pin dual in line package. As such, the DS12887 is a complete subsystem replacing 16 components in a typical application. The functions include a nonvoilate time-of-day clock, an alarm, a one-hundred-year calendar, programmmable interrupt, square wave generator and 114 bytes of nonvoilate static RAM. The real time clock is distinctive in that time-of-day memory are maintained even in the absence of power.

Watch of shorts between solder pads after removing old chip.

Sounds like you need 8 4mb 30 pin sims. You can tell they are 4 mb by looking at the pins on the chips. 2/3 chip is the most common. The 3rd chip is parity, you will notice that looking at the 3 chips, 1 is different. Don't wory the ST range don't use parity, so just disregard the 3rd one. On the other 2 chips you will see that there are 24 pins on each, 1 MB only have 20 pins. The numbers can vary between manufacturer, so they are not always a good indicator. There are also 8-9 chip varieties, but they are not as common.

The -70 or -7 is they only real important part. This is the speed of the chip in Nano seconds, -6 or 60 Nano seconds is better, the ST is limited to 120 ns, but don't know how critical this is on the TT. Considering it is TT ram I would suspect that 60ns is better. Probably make sure they are all the same speed.

The Jumpers I don't know tho.

Regards

Mark

Hi,
Just posting to clear up a point
On 12 Jan 2003 16:48:40 -0800, ekaljuma@mtsac.edu (Galen) wrote:

In fact the Link97 *DOES* provide SCSI arbitration, that is its main advantage over the original ICD adapters. So you can use a typical CD recorder with any Atari. If you have a (Mega)ST(e) you need the Link97; Falcons and TTs can just use the SCSI bus (as long as the driver supports arbitration).

Disclaimer: I don't make, sell, or profit from Link97s :-)
Roger

Thanks for the info.
Reassuring it is just a matter of counting legs.
A well established method of distinguishing between sheep and people.

I'm fortunate indeed...
My unit does indeed have an MROS compatable ROM.
Now, if I can just figure out what all these modes and parameter do!!!
Has anyone a list handy?

Time to start a new thread...

Brian

Now I have an SMP 24 to use with CuBase Falcon Audio.
Sadly, I have no manual, and this thing seems to have a million and seven programmable things about it. Does anyone have a list of parameters and what they do? An extra Manual to sell...or willing to loan yours out long enough for me to make a copy?

If I can get a listing of parameters at least....I'm thinking I could figure it out from there.

One thing I'm trying to figure out ASAP if someone with a manual can help.

I have a tape device striped with 30fps SMPTE time code. This track is being sent to the 1/4" SMP 24 SMPTE input. I did manage to figure out how to get the Falcon/SMP to stripe a tape...so time code compatability shouldn't be an issue...this code was written via the SMP 24.

I can't figure out how to set this thing up so it will lock to the timecode on the tape, and in turn lock the Falcon as well. In theory...I should be able to set a song start point, offset time in CuBase, disable master, enable sync....then pressing play on the tape should start the Falcon playing in sync. So far, I can't figure out how to make this happen! Any help would be very welcome.

Thanks,
Brian

> get it to install on a ST with a 720K drive?

It should come both ways. Specify when ordering; however, if you already have the HD version here's what to do.

Use a machine with an HD drive to transfer the data to DD disks. If you need more DD disks than HD ones, don't worry about it, just get all the files on ANY DD disk.

If things turned out so that it took the same number of disks...simply run the Install program from your floppy.

If it took more DD disks than HD ones, make a folder on the ST's hard drive, and copy all of the files from your DD disks into it, then run the setup program. It will install from the hard disk.

Hope this helps,
Brian

You might try contacting Atari Workshop in England. Some time ago, I bought a used memory board by GE Soft from a fellow in England, which he had purchased from that company, so I contacted them and got the proper jumper settings. I cannot find that paper, and my settings for 128 K might not help.

Jim

I have never been able to get a working cli prompt under Toswin2
on this Milan. I either get pexec errors when I Start Shell... from
the menu or the machine locks-up when I double-click on sh.app

So this morning I methodically disabled most of my AUTO folder
and I got a prompt !

I then re-enabled the AUTO folder item by item. I suspected WDialog
but that wasn't the cause. Quite by accident I re-booted with ExtenDOS
disabled without enabling DRVIN (part of HS-Modem). This meant that
the rest of HS-Modem didn't install but it did mean that the Unix shell
worked.

After a bit more experimentation I confirmed that it if both ExtenDos and
DRVIN are disabled then the Unix shell works under TosWin2. However
it isn't very useable. The key response is *very* slow and some key
presses are caught by the desktop and not the console and vice versa
when I am using the desktop ! Very dangerous.

I cannot figure out why these two applications should affect the console,
there doesn't seem to be any logical relationship.

Peter

Why do you want to use HS-Modem under MiNT on your Milan? The proper MiNT
serial devices works much better.

Hi Peter,

PS>I have finally succeeded in creating a Unix partition ! I now have an
PS>EXT2FS partition on G: but when I open the partition in Thing it gives
PS>me a warning about mounting an unchecked device and asks me to run
PS>another program to check it. This cannot be normal but hopefully
PS>should be easy to fix. Any ideas ?

When using MiNT with one or more ext2fs partitions, you must do a correct
shutdown with shutdown.app. That's necessary because otherwise the
'clean-flag' for the filesystem is not set. This is checked by starting

e2fsck.ttp after MiNT (mint.cnf) or when you open a ext2fs partition from
the desktop.

Johann

Indeed they works much better but... they won't work with STinG/STik. At
least not on my setup.
Anyway back in the old days I've used HS-Modem etc. with my full-blow
MiNT-net setup without any hassle together with toswin2.

I don't have a clue what's wrong on your setup. All I can say on my
setup I don't have troubles with the Unix shell (in my case bash) and
toswin2.
Nowadays I don't use HSMODA anymore on my MiNT-net setup. I use the
proper MiNT serial devices. However in the rare occassion I use STik or
STing I use HSMODA as the MiNT serial devices seems not to work under
that setup. They lock the bootprocess.

Anyway the shell works correct under that setup. I use BetaDOS/Spin
instead of ExtenDOS. Furthermore I also use the RSVF Gemdos driver for
MiNT (rsvx.prg).
In auto I've:

```
...
-rw-rw-rw-    1 root     wheel        3919 Jan 25  1998 drvin.prg
-rw-rw-rw-    1 root     wheel        5223 Apr  8  1996 mfp.prg
-rw-rw-rw-    1 root     wheel        8756 Jun  8  1996 scc.prg
-rw-rw-rw-    1 root     wheel         374 Mar  1  1995 rsvx.prg
-rwxrwxrwx    1 root     wheel      251996 Aug  1  2001 mintnp.prg
```

In /mint I've hsmint.xdd

As MiNT seems to kill rsvx.prg I load rsvx.prg for a second time from
mint.cnf. exec c:\auto\rsvx.prg

rsvx.prg is aprt of the HSMINST1 archive. It can be found on the Belgian
ftp-server in the mint/net dir.
It's also on lots of other servers (funet.fi, umich)

HTH,
Martin

Thanks, Jon.  It looks like I can buy a new Stacy keyboard for $90.
Not cheap, but if I can get another ten years of using the best
sequencing software ever available (C-Lab/emagic Notator SL) it will
be worth every penny.

To answer my own question...
I discovered the problem was a bad/noisey audio cable!
Swapped that and it now syncs to the tape no brainer.

Brian

Hi All,
I was the proud owner and user of an Atari STe for nine years untill May of last year when I was awoken during the night by explosive thunder from a very close lighting strike. My ST was connected to a modem at the time which on inspection I noticed that all the LED's were glowing even though it was powered off. This was not looking good. I then quickly switched on the computer, the green power light came on and that was it. Nothing else happened. My ST was dead.
Although there was no direct lightning strike, I can only guess that the closeness of it induced high levels of static electricity in the telephone wires and into the modem and the computer.
I opened up the ST to see if there was any obvious damage but there was none. Is it repairable or is now trash?
Any help would be welcome.
Thanks in advance.

I have just cured the slow response problem. I noticed that EasyMint had
a newer version of XConout (whatever that is). I am now on 0.3 instead of
0.1

I have tried the Mint serial drivers but cannot get any reponse from either
the modem or my Palm PDA. Is there any sort of test program that can
"ping" the serial ports ?

>Anyway the shell works correct under that setup. I use BetaDOS/Spin

I used to have Spin but when it came to choosing a set-up for a CD-RW
then ExtenDOS and CD Writer Suite was the logical choice. It's really
easy to use and Roger is always very helpful.

> Furthermore I also use the RSVF Gemdos driver for MiNT (rsvx.prg).

What is RSVF/RSVX, I haven't heard of it. Is it Hades specific ?

Thanks Johann. I have now changed my shutdown setting to "Halt system" and the
warning and boot-up file check doesn't happen.

Marc-Anton also explained why I couldn't ext2fs the LNX partition. There is a
small problem in HD-Driver 7.7? and all I had to do was set LNX as a partition
type under the Advanced settings in HDrutil.

Thanks guys,

Peter

I had a lightning strike a few years ago via the same route - the only thing plugged into the outside world was the modem. My Falcon continued to boot and operate normally, but all the ports were fried, the modem died obviously, and strangely enough the printer too. The current must have gone straight through the computer and to the printer.

Systems Solutions repaired it for me - in fact they gave me a complete new motherboard.

Hi folks,

I still have my old external floppy drive for the ST somewhere around.
But it does not work anymore. I tried it as drive b on my 1040 and it
will not read any disks.
It is not an Atari drive. It is a standard old dd drive in a case with
Atari adaptors - almost like a box with power supply for a pc drive.
Now my question is:
can I simply exchange that old dd drive inside of the case for a modern
HD drive?

(I know I will only be able to use it as a DD drive on my ST)

Any ideas or comments?

cheers,
Matthias

Hi Peter,

PS>Thanks Johann. I have now changed my shutdown setting to "Halt system"
PS>and the warning and boot-up file check doesn't happen.

I think the other settings should also work, as I used them also. But you can also set the 'clean-flag' yourself, if you're not shure, that the shutdown works correct or there is the possibility of a freeze in the system. You just have to set the ext2fs partitions read-only with Fsetter, that has the same effect as the shutdown.app.

Johann

Hi,

I've searched Google news & web with no answers. I'm trying to use my old Megafile 30 along with a 170 meg SCSI disk & Link (original) I got from a friend (I want to transfer the Megafile's contents to the SCSI disk).

No matter what I do, I can't get my ST to see both drives at the same time. Either one alone works fine.

I have done the obvious thing: set both id #'s to different numbers. I even read in my searches that the Atari likes *consecutive* numbers so I tried that too. No go.

I'm using the ICD software that came with the Link and have also tried the latest demo version of HDDRIVER.

Any help appreciated. Thanks!!

Rob Aries

PS--a related question: There are three small DIP switches in the Megafile. It seems only the leftmost two allow me to set the id (from 0 to 3). The one on the right seems to have no effect. Can anyone shed light on this? What is that switch for? (I did try it in both positions just to be sure).

> What TOS does your Atari have?

I have STe and STf.
I believe the STe is TOS 1.4, not sure about the STf.
Anyway, I will be using the STf for .st and .msa files.

> you will need a formatting program for the Atari that will put a PC boot sector on the disk.

Please email me the program.

Thanks again!

Yes, that should be possible. I have a GE Soft card (can't remember which type) in my TT with 8 4 MB SIMMs.

```
>There are also 3 jumpers currently set:

Here is some information on the subject taken from the rather large (6728556 bytes!) CHIPS_X.HYP (Michael Ruge) that you might be interested in. Also some other GE Soft cards are described:

Jumperbelegung			Bankbest�ckung			
J0	J1	J2	Bank 0	Bank 1	Bank 2	Bank 3
2-3	2-3	2-3	4 MB	4 MB	4 MB	4 MB
1-2	2-3		16 MB	4 MB	4 MB	4 MB
2-3	1-2		16 MB	16 MB	4 MB	4 MB
1-2	1-2		16 MB	16 MB	16 MB	16 MB

```
   +--------------------------------------+
   |                                      |
   |                                      +---------------+
   |              Bank 2           Bank 2                |
   |              Bank 1           Bank 1                |
   |              Bank 0           Bank 1                |
   |              Bank 0           Bank 0                |
   |                                                     |
   |                                                     |
   |  6*PALCE20V8H-150,  einer leer,  3*PALCE20V8H-150   |
   +-----------------------------------------------------+
```

Die Migthy-Mic 32 wird mit Page-Mode Ram-Modulen in SIMM 30Pin Bauform mit einer Zugriffszeit von 60 bis 80ns best�ckt. F�r eine 16MB Bank ben�tigen Sie 4St. 4M* 8(9) und f�r eine 64MB Bank 4St. 4M* 8(9). Eine Einwandfreie Funktion gew�hrte GE SOFT damals nur mit SIMM Modulen der Hersteller Samsung oder Toshiba.

Note that there seem to be some erors in the Mighty Mic 32B description.
If you check out the other Mighty Mic 32 you can find your present jumper
settings etc...

I just put a copy of chips_fr.zip at http://w1.316.telia.com/~u31612658/
temporarily as it is a little long to email. And no, it's not in French!

Uploaded with Aftp/STinG/EtherNEC at 37 kBytes/sec using a TT. Not too
bad imho...

In a related question, can anyone tell me how to add a new partition to my Mint system? For example, I have used my HDDriver 8.11 to set the partition type of another partition to ext2. However, when I modify fstab in my etc directory so that the new type of the partition is ext2 and reboot, the system is unable to mount the partition. I noticed during the Easymint install on my first ext2 partition that it made some filesystem commands to pepare that partition.

Do I need to run something like mke2fs on the second partition in order to get MINT to recognize it on boot up?

In summary:

C: BGM (boot)
D: LNX (ext2, my Mint software)
E: the partition I'm trying to get MINT to recognize and use.

Sean

Hi Sean,

> Do I need to run something like mke2fs on the second partition
> in order to get MINT to recognize it on boot up?

Yes, you�re right, without creating a ext2 (or other filesystem) you
won�t have access to this partition.

Ciao

Marc-Ant�n

Hi fellow Atarians

The New Year has started off well for me.An ex Atarian (although he still drops in on news groups now and then) has very kindly passed on his Falcon,completely free,to me.This includes an internal Hard Drive,coloured monitor and external modem.Much software has also been thrown in.The machine has also been upgraded to 14MB.

Having only ever used a STFM and STE (still have 2 of each hooked up) I have been used to using external help.ie 2nd disk drive,CD ROM etc. Is it possible to do the same with the Falcon? The manual with the machine is not really clear on that point.

Any advise would be appreciated.The hard drive is full of software,some older than mine and some younger.Some I will never use but will obviously keep.

I intend to pass the equipment on to my eldest great grandchild once I can no longer make use of it.

Regards Derek

Is the CD ROM a SCSI device?  The Falcon has a SCSI interface built-in.

Of course. You need the lead from the SCSI port on the back of the Falcon, connect the other end to your SCSI devices, you're done.

You didn't say what hard disk driver is installed on the Falcon's drive, if it's HDDriver you will most likely have to configure it to recognise the IDs of the drives you've added.

Cheers

Derryck

Don't get confused, as the Falcon SCSI port is actually SCSI-2, not the SCSI-1 that you are probably used to with STs. So you will need a cable with a SCSI-2 plug on it for one end and whatever plug on the other for your CD-Rom drive.

Also, note that the Falcon does not have an external floppy disk drive port, so you cannot use external 2nd floppy drives.

Cheers for now!

James

If both are hooked up, do you see just one, or neither?

>I have done the obvious thing: set both id #'s to different numbers. I even

That's a feature of the standard AHDI software, it's not necessary with ICD & HDDRIVER.

> No go.
>

What cable lengths are you using? Atari recommends a max of 72" total length, and no more than 24" between controllers.

Due to chip loading, Atari advise a maximum of 4 controllers on the
ACSI bus. Perhaps that's why you can only set 0 to 3 ? (just
speculating)

Roger

Rob,
This may be nothing.... I have a Megafile 20, 30 (modified with a 44 meg drive) and a 60 all connected to a Mega 2. When all are at different id's, the 30 and 60 work fine. When I add the 20 to the mix, even though they are different id's, it clashes with the 60 and will only allow me to "see" the 30.   I have spoke with Brad at Best Electronics and he advises me that some of Atari's Mega drives don't like to co-exist with other devices, even their own brand.   This may be what you are experiencing. Cable length on my particular setup is 96". That does not pose any problems as long as it is under 18 ft total. I have taken the 20 out of the mix and all is fine. I guess I'll use it on one of my other Mega's. By itself, it's fine!

You are almost correct on the dip switches. I have found that 1 and 2 do the low settings and adding 3 is for the higher id's.   If you don't already have Best's catalog, I recommend it just for the tech notes in it.

Hope this helps a little

how do you change the drives in the units, do you have to change any
dipswitches/jumpers?

You can just unplug the old drive and plug in the new drive. If
it is not a Seagate drive recognized by Atari hard drive formatting
tools, you will have to edit the WINCAP file (if I remember correctly)
to input the right values for the new drive, i.e., # of tracks, cylinders,
etc.

Also of interest may be the fact that Megafiles can support TWO drives.
To do this, you have to solder in two rows of pins, acquire some extra
cables, and make some room for the extra drive. AHDI won't support this
type of arrangement, though, so Supra Hard Disk utilities or ICD utilities
must be used to see both LUN's on the same ID.

The STE is TOS 1.6 or 1.62 (cures the restart in medium resolution bug) so
all have to do is format the disks in the STE and then...
Having said that I find for the best results format in the pc then the ST's
should both have no problems.

CoMa is a real good one. See <URL:http://hartmann.soft-ware.de/>

CoMs is an answering machine, Fax & Voice-On-Demand-System, Send & Receive Fax, Mailbox & Terminal with internal Z-Modem.

See also on the Belgian ftp-server
<URL:ftp://chapelie.rma.ac.be/atari/telecomm/j-off304.lzh>
<URL:ftp://chapelie.rma.ac.be/atari/telecomm/star32de.lzh>

Staroffice (star32de.lzh) is also a very good fax program which offers quite some other possibilities.

HTH,
Martin

I recently took my ST out of mothballs after 7 years. I used to use it with a floptical drive and ICD Link. The drive died, so I got another one from Ebay, but it doesn't work. I'm hoping it's a jumper issue.

I found this on the web, it details the jumper functions:

****

I325VM POWER CONNECTION AND JUMPER OPTIONS

Looking toward the rear of the drive:
Cover of drive on top: Ground is circle (o)

```
2MM shunt Jumper
*  *  o  o  o  o  o
*  *  *  *  *  *  *    <- Jumpers
E7 E6 E5 E4 E3 E2 E1
```

[sorry if these don't line up exactly, you get the idea!]

E1 Drive Select 1
E2 Drive Select 2
E3 Drive Select 3
E4 Enable SCSI Parity Checking
E5 Enable Unit Attention after SCSI Reset

E6 & E7 Terminator Power Options	E6	E7
No Power	Open	Open
SCSI Power	Open	Short
Drive Power	Short	Open
Drive & SCSI	Short	Short

****

I can figure out E1 to E3, that's obviously for selecting the id #. I'm not sure how to set the parity, terminator power, or the "Enable Unit Attention after SCSI Reset" though.

Right now this is what happens: when I turn on the drive the busy light stays on. When I turn on the ST it goes off. The drive is not seen at all by the ST (I tried HDDRIVER, scanned the bus, etc.). I've tried a few different combinations of jumper settings with no luck. The Link & cable is OK because I've used them with a SCSI hard drive.

What makes me think the floptical mechanism is OK is that, when I insert a disk, I can hear the head seeking to the boot sector normally. However, it might be that the drive is not good because it was an "as is" auction with no guarantee. If I knew the exact way to set these jumpers, it would save me some time trying to figure out if the drive itself is bad or not.
Thanks!!

Rob Aries

>can remove the two files I put in (both .prg's)

If your boot process gets as far as running HDDRIVER, keep the [A] key pressed during booting and it should boot from that (i.e. no hard drive). Then run HDDRIVER from the floppy, install a C icon and you should be able to access C: to remove the offending files.

Regards, /Peter/

Can NVDI be installed in the auto folder or do I need to run Mint or

```
MultiTos?

Also, where would I buy NVDI?

Hi again,

I've never seen an sh204 converted to scsi, the sh204 contains an mfm host adaptor. Finding a version of ADscsi, or Link for example (among others) would be a sure bet for using a scsi drive, which will likely be larger and a bit faster than an mfm drive. You could keep the sh204 for when you do find an mfm driver later on and use it as a backup or second drive at some point.

It just goes in the auto folder, and has some extra setup tools
as CPX. NVDI works with mint or magic (optional) or plain tos.

Good question. Someone want to jump in with a dealer that has this?

Atari Workshop (http://www.atari-workshop.co.uk/) and 16/32 systems
(http://www.1632-sales.zenwebhosting.com/acatalog/) in the UK both
stock NVDI (version 5) as does B&C (http://www.myatari.com/) in the
USA though I'm sure there are others.

Ok, I will check into it. I have been out of the Atari scene for about ten
years and have now got back into it. I have aquired a 1040Ste with 4 megs
and a 50 meg hard drive.

I have been looking into an alternative operating environments and have been
interested in Geneva and/or MagiC. Why would you choose one over the other?

```
I have not seen anyone selling MaciC, I have seen that Gribnif still sells
Geneva

Any comments?

I'm sure the outlets I mentied will stock either or both Geneva and
MagiC. Personally I'm happy with my Falcon as is (plus I tend to be a
bit of a purist) and so I don't see the need or expence involved on
purchasing a copy of Magic, my only reason for doing so would be to
have "Windows" FAT compatibilty and be able to use long filenames on
my ST but as I only have 2.5 Meg it's not really worth the space for
me.
As for Geneva I do have a copy on my ST as it only has TOS 1.02 (aka
1.2) which can't be easily upgraded and I decided that having the
Crtl+Alt+Delete keyboard reset, DOS compatible disk formatting and
Program Icons on the Desktop features that became standard on TOS 1.04
upwards would be useful.
As you have an STe which should have TOS 2.0x I personally doubt you
will find much of an improvement in using Geneva although I use very
few of its functions however you may find some MagiC more useful, I'm
sure someone here more versed in their use than me will be able to
point out their relevent vertues to you.

You may want to buy MagiC through ESNA. Just follow the link in my
signature.

Best regards,
P. Ricard

```

Hello everyone,

Just a quick question from a non-expert.
A friend of mine makes music on his Atari.
How can a get his midi files on my pc?
It seems my DOS diskettes are not recognises on his atari and his Atari disk
ar not recognised by my pc???

Marcel

> I have been looking into an alternative operating environments and have been interested in Geneva and/or MagiC. Why would you choose one over the other?

Why would you want either one?
They both speed things up considerably...especially if you also add NVDI.
They both fix various TOS/AES bugs or shortcommings.

If you are interested in putting your ST on a lan/ethernet/adsl/cable/etc, or going online with a modem...one of these will definately improve performance and flexability. I.E. you could dial into your isp and have email, telnet, a browser, and ICQ all running at once.

Beyond this...it really depends on how valuable multitasking is to you.

Geneva:
This is simply a cooperative AES replacement that allows more windows, more than one application to be run at once, and user flexability on how things look and work. This AES is FASTER, better looking, and more configurable than the one built in your ST. Geneva is quite useful even in very very low memory situations...with or without a desktop. It can be run with some mint kernels to achieve preemtive multitasking abilities. It does NOT come with a desk-top. You'll have to add a desk-top if you want one (NeoDesk, Thing, TaraDesk, etc). Geneva hasn't seen development in a quite a while, where both MagiC and FreeMint have undergone much....

MagiC:
This is a full TOS/GEM replacement.
You'll want at least a 2meg machine to really see the advantages. Since you've a 4meg machine...all set here :) MagiC is a fully preemtive multitasking kernel. It supports long filenames, and even includes some networking extensions or sockets that are built in. MagiC can also support things like Disk Cacheing...background floppy access...and if you use HDDriver...background DMA hard-disk access. MagiC does come with the basic, but zippy and useful

MagiX desk-top.

N.AES:
This is similar to Geneva, but much more up to date, and REQUIRES that you run a Mint kernel. It comes with a coustom version of the Thing DeskTop. It's NICE, but not nearly as friendly on memory and system resources as MagiC and Geneva.

FreeMint:
Here's yet another option...all free.
There are several freemint kernels about on the net. I'm not sure which would be best for a 4meg STe...but there's bound to be one that's small enough. Next, you'd add one of the freely avilable AESes. XXAES or AES4_1. The AES4_1 does have a basic desktop that looks and acts very much like the one already built into your ST. XXAES is a MUCH better AES for more reasons that I care to list here. Thoe XXAES doesn't have a built in desk-top, it can be used without one, and it's easy to add any desk-top you like, such as the now free TaraDesk, shareware Thing, or Commercial Jeenie (sp?). Depending on what freemint kernel you choose, it is possible to support long file names, and even unix oriented hard-disk partitions with permission controls like ext2 or minix.

FreeMint options are going to open you to all sorts of unix-like environments and networking opportunities, but tend to be a bit slower and memory hungry than MagiC. Since they are free however...why not take a look?

Hope this helps,
Brian

Grab this free GEMXPLOR utility (the first url is the page it can be found on, the second url is a direct link to the GEM Explorer utility). BTW, this utility can also look at an ST hard drive connected to your PC (usually requires a SCSI host on your PC).

http://www.emulators.com/download.htm
http://www.emulators.com/freefile/gemxplor.zip

Launch it on your PC...
Stick the ST made disk in your floppy drive...
Browse the floppy and drag the files you want to where-ever you want it on your PC.

That's the simple way ;)

Other method...
Is to format a DOUBLE DENSITY disk on your PC, then use the ST to move the files to this new disk.

Hope this helps...
Brian

Where is a good source for getting these old MFM/RLL mechs?
My Megafile 30 recently bit the dust and I've ordered the bits to just build a
true SCSI chain via Link 97. Still...I'm courious about the possibility of
replacing the drive mech (assuming that 'is' my problem).

Thanks,
Brian

In the past I've used Hewlett Packard 560C and Hewlett Packard LaserJet 5L
with my Atari's, I've also known your Canon bubble-jets to be used.

It depends on the age of his Atari. If it is a really old model it could have a 360k drive in it, in which case you will have problems either way. If it is a later model it will have a 720k drive, which is compatible with the PC. You can either download a program for the Atari to format the disks as PC compatible, e.g. PCFROMAT from

http://www.umich.edu/~archive/atari/Diskutils/

or format one of his 720k disks on the PC. (Actually you have to do this anyway to get the program to the ST).

I used a 4-color Panasonic printer with my ST and it worked fine.
I would assume any simple Epson should work. Sometimes you may get
lucky. My wife has a HP laser printer and it worked fine with my
Atari as long as I did not print any graphics. Text was great...

What TOS does your friend's Atari have? Tell him that there are
formatting program that will put a PC bootable sector on disks
formatted in the Atari, but if his TOS is 1.4 or higher,
formatiing on the Atari will automatically put the PC boot sector
on the disk.

Does the right light on the Link II still light up? Could be the
SCSI cable. That happened to me one time. I just disconnected the
cable, gave it a stretch and then put everything back together.
Worked fine after that.

Thanks Brian, that is the kind of review I have been looking for. Basically
I want a machine that does simple multitasking with a replacement desktop.
I think MagiC is what I would be interested in.

Well, that's sort of correct :-). If you had an 'older' SCSI drive, it should probably work. Unfortunately, many recent SCSI drives (including some Quantums) require SCSI arbitration which the Atari adapter (and in fact the ICD adapter) doesn't supply. Either try to locate another SCSI drive, or buy a Link97 external adapter (which does support arbitration).

Roger

Hi Brian,

Theres a few ways to locate the now hard to find mfm / rll / esdi drives. You can try computer flea markets and user groups, not just atari specific either. early amigas and xt clones (kludges) have this type of drives. even garage sales and hamfests can often turn up some of these drives. Also computer surplus stores sometimes might have one or two around.   Also theres the old standby's of some atari mail order dealers (Best Electronics, video 61, bravo sierra, ATY and so on) might have some. Last year to fix a megafile 30 drive I have (uses ST-238R drive mech) I found an old mfm drive (which I saved for later) at a surplus store and also an identical ST-238R drive from an amiga user who had a spare one.

Try and get a printer with Epson dot matrix and/or HP Deskjet/Laserjet emulation, Most modern laser printers have Laserjet emulation unless their a Windows only printer. All printers worth their weight in salt have Epson emulation.. I have a fairly recent Epson 5700 laser printer which works fine under laserjet emulation.

I tried makedisk:

```
makedisk /write stf79.st /auto
```

And all seemed fine, but when I put the disk into my Atari
.....zippo....blank disk

I ran it in a Dos box with a 1.44 meg drive and a 720k (new) disk. (I know, these are hard to get, but I found em)

Same problem with wfdcopy

Any ideas?

Hi,

For the past fwe days i've been working on a project to upgrade my 1040STfm's memory. I looked about for a guide to use 72 Pin Simm, but to no avail.

So I did it anyway. - Using an 4MB stick (was gonna use an 8MB stick, but wanted to see if was possible first.)
(p.s I know it wont recognise the 8MB, but i was gonna see if it'll use 4MB

from it)

Im still working on it right now (posted here in a short break), and so far have got 2.5MB running (Low Ram still in place (512k), but High is 2MB) - Enabling the other 2MB is a case of 3 wires, so i'll post back.

Anyone who 'has' done this, what problems did you run in to?

I'll take pics l8r if interested?

Dan.

Hi,

Have you seen atari.nvg.org, one for a Stacy but I modified it slighty to use on my STFM. Word of warning, use as many grounds as possible, make sure your simm is 5v and FPM (not EDO!). If you have one bank working you should get the other bank fine. I had problems which turned out to be a solder whisker causing a short on two high address lines on the CPU that stopped more than 2MB to be visible. You can disable the old 512kb of on board ram by pulling the RAS, and two CAS to Vcc.

Mine is working fine and runs at double speed as it's 60ns, I changed oscillator
as well among other things.

Yeah, I just found that.

I notice it uses a RAS 2 instead of 1.

So far I have the one bank working, but the second just corrupts, so i'll
dig out another stick 2mo.

Whats up with EDO stuff then?

Hi,

> Whats up with EDO stuff then?

All to do with the output enable inside the DRAM devices. FPM ram has the output enable disabled as soon as CAS comes high. On EDO, the output enable is instead bought out to a pin on the DRAM chip, and usually tied low by the SIMM PCB layout. So the ST MMU and many other machines like older 486s and below pull CAS high to disable the outputs, and when EDO is installed outputs continue to drive and corrupt the data bus, bus contention.

EDO is built like this so that you can pull CAS up early, and the data arrives when CAS comes back low. Fast burst mode, I think 60ns EDO is equivilant to something like 30-40ns FPM. Edo has some other nicefeatures, I think some support auto incrementing address counters for bursting.

You can modify a EDO simm (because it's cheap) to FPM style in theory by intercepting each DRAM chips /OE and hooking it to the CAS line. Though this may not work with all all sorts of simms, I think the sort that have very few DRAM chips that have multiple CAS lines and only one /OE. I've been looking into this as AB040 only accepts FPM. I do have a 32MB of FPM but would like matching pair of Simms with as small as possible CAA to data time to aid overclocking.

Okay,

This is a weird one...

The video blinks on and off usually after a couple minutes. Sometimes it moves the display slightly, other times the entire screen goes black, but comes back in less that a second. I will be swapping out RAM modules (a 4 meg Atari Board, 14 meg RamGizmo, and a F030 Memory Expansion Board by PCS AB) to check if that has any effect.) . I can try a Phillips 105S 15" too.

Any hints?

Thanks
Rory

I thought some of those who are monitoring this newsgroup for CPU deals would be interested to know that Vernal Elm LLC (http://www.vernalelm.com) is offering a deal on Motorola 68060 50MHz processors that is good through December 31, 2002. They are only $85 each.

The CPUs are full versions (MMU/FPU), so they're the right kind for Atari accelerators like the CT60 from Czuba Tech, the Milan, etc. They also come with a 30-day unconditional warranty, so you can return them for any reason within a month.

Check out the website or e-mail sales@nospam.vernalelm.com (remove the nospam.after the @ sign before sending message). Thanks for reading -- accept my apologies if this message was a nuisance.

Sounds like it could be the videl. Corrupted memory just tends to draw pretty colors or just plain crash. This is similar to behavior exhibited by my MSTe with a bad video shifter chip. My first suspicion however would be towards that monitor. Definately the monitor should be tested first.

Mark,

Thanks for the info... I found out what was wrong...

I forgot to check the obvious... I forgot to tighten the monitor
connectors on the back of the falcon. Put a support under the
connection and no blinking...

Rory

That depends on the size of the EPROMs.

TOS 2.06 comes in 2 27C010 (128KB per EPROM), so a set of 27C040 will have space for 4 TOS images, a 27C080 will accomodate 8 TOS - 27C080 is the biggest that is available in a compatible footprint.

In any case, you only have to take the upper address lines that are not present on a 27C010 (2 on a '040, 3 on a '080), disconnect them from the mainboard (stack of 2 sockets or bend the pins out of the socket) and wire these lines to either VCC or GND to select which TOS image to use.

For 4 images, you could also use two 29F040/29C040, which are flash ROMs - if you have a compatible programmer, these are easier to re-program since you do not need an UV eraser.

Brent:

Like you, I have had no success with makedisk or wfdcopy
when going from a *.st file to an ST disk. I even ran them
on an old PC which just had DOS on it. I even used floppies
that I first formatted on my 1040STE.

By the way, 720K (new) floppies are easy to get on eBay. I
recently bought a box of 100 new for nothing.

Hi, Hallvard;

Yes, I have done that. You may have noticed from my posts sometime last autumn that I have made an 8MB alt-ram board for my Mega ST (btw. I am now working out an improvement of that). This board contains two 256KB EPROMs (27C2001) into which are burned a patched version of TOS 2.06 and also Magic. Each OS occupies half of available ROM space in each chip and selection is done by a switch, via the highest address bit (i.e. set to gnd for TOS 2.06 and to +5V for Magic). These 27C2001 chips are 32 pin packages and are pin-compatible with the 27C010/271000 normally used for TOS 2.06 except for the highest address bit (pin 30). On the MegaSTe schematics which I have, this pin is shown as connected to +5V, so you will have to bend the pins out of the sockets or else cut the traces.

I think that other manufacturers produce pin-compatible EPROMS with the marking 27C020 (similar to 27C1001/27C010 case for the smaller capacity). You would need two of them. Btw. you CAN also find a suitable 16-bit EPROM for burning everything in ONE chip, as you originally said, but that chip would not be compatible with sockets you have on your machine, so probably that is not what you want.

So, you will have to divide OS images into two: "odd" and "even" and burn them in a pair of chips. (because these EPROMs are 8-bit and databus in STs is 16-bit wide). "Tospatch" utility (mentioned here many times before) has provision for doing this (beside other useful things). For Magic, use "Magicrom" utility (can be found on the 'net as well), and make it produce a corresponding pair (odd/even) of images. In each EPROM (i.e. odd/even) you burn TOS 2.06 into lower half of address space and Magic into upper half- EPROM programmers can do that, there is no need to fiddle with addresses in images, just leave them set for $E00000 (that is the standard starting address for TOS2.06). Note that odd/even images produced by Magicrom are NOT named in the same manner as odd/even images of TOS produced by Tospatch, so take care not to mix into one chip an "odd" image of one OS with an "even" image of another.

Note that there are further possibilities (I did not install that, just retelling what the docs say): "Magicrom" can produce dual-OS EPROM images (for a pair of 256KB EPROMs such as 27C2001) such that the OS can be selected by pressing a function key at startup (i.e. no need for a switch). For this to work, you must lead the missing address line from the CPU bus to pin 30 of EPROMs, and the "chip select" decoder on the motherboard must allow you to select more than 256KB starting from $E00000. If you make your own address decoder for OS EPROMs (as I did) that is very easy (easier than make it recognize just 256KB), but I don't know how does the chip-select line in (M)Ste behave: would it come active in the complete 1MB available address range starting from $E00000, or just for the lowest 256KB of it?

"Magicrom" will also let you install the (freeware) CBHD hard disk /SCSI driver into remaining free ROM space.

>> Don't raise too much of a sweat Hallvard, eeproms cost pennies.

>Doesn't seem like it from my electronic component catalogs. Maybe if
>they're second hand, but I haven't found any companies selling them
>used.

I agree- thay are not exactly cheap, especiallyu if you go for the higher speed (Btw. you should not go for EPROMs slower than 150ns).

In an earlier discussion in this conference M.Schwingen remarked that it -might- be possible to use flash (i.e. reprogrammable) eproms which supposedly could be programmed in-situ (in the computer) using a suitable writing algotithm. You could also use a pair of static-ram chips (there are pin- compatible ones) with a battery backup (should last for several months without recharge), but such designs could be dangerous if you do not have a ROM based OS in the computer to boot in case of battery power loss.

>I was lucky a few years back as I managed to salvage several 2716 and
>2732 EPROMs from various broken computer boards, but those are of course
>way too small for the above use.

Note that -some- old PC boards contain 128KB EPROMs (27C010/27C1001), so you can indeed get them practically for free- but you may have a hard time finding a pair with equal specifications, because such motherboards were not common. You could use four of such chips (mount a pair piggyback on another pair) to achieve what you want- but beware of databus load- I found that in my MegaST the DMA chip (I am unlucku to have that DMA-chip variant which is notorious for making problems) did not like the increased databus load. When I added the Alt-RAM board, the new pair of 27C2001 EPROMs was connected to the databus without removing the old TOS 1.4 EPROMs (six 25C256 chips), so that now there were eight of them sitting on the bus. I started getting hard-disk errors which disappeared whenever I removed -any- one of the four pairs of EPROM chips (I used a RAM-based TOS on these experiments).

Bbtw. I, too, obtained my 27C2001s (in fact, NEC 27C2001-D, whatever the "D" may mean, could not find it on the 'net) second-hand from some unrecognizable electronic board found on a flea-market for a price of 1 EUR :) They are 170ns, which is just enough for operation in my alt-ram board- but I will probably be in trouble if I decide to accelerate the computer to 10 or 12 MHz.

Regards;

Greetings,

I am trying to get an old Alldata system up and running. It is the Atari system with SCSI 50 pin cd-rom and somekind of DOS graphical GUI by GEM / Atari.

I am having two problems, of the floppies provided, one appears to have the alldata.prg file but it fails with what looks to be a memory error (?) and the other complains of an invalid code, the third and latest date (1999) appears to have nothing on it at all.

When a CD is asked for by the working (?) floppy with alldata.prg running, the drive looks at the CD in the caddy but doesn't do anything else (except the memory error-like thing on the screen and reads, "Press mouse button to continue."

Does anyone have an idea of what to try next, or maybe someone has a woring floppy from this vintage (system 3, I think) and could provide the image of it. Its a shame to see this system and its set of cds with so much data go to waste.

On another note, can these cds be read by any other system or an ibm-pc with some sort of emulator running to translate them?

I included two old threads on this item from comp.sys.atari.st.tech and then rec.autos.tech for reference (older than a month).

Any help would be appreciated, thanks!
:)

I have an Alldata System 3 Computer for automotive service manual and we have problems.
This runs on an Atari/ST board and has a scsi cdrom shuttle however the system does not see the the cdrom.
I have change the drive with no help from that.
Guy's I dont really know what direction to go and have never worked on an Atari.
Any Suggestions on this problem?Message 2 in thread

Not sure what you mean by a "shuttle" - please explain.

>Any Suggestions on this problem?

If it's really an ST board (as opposed to say a TT or a Falcon board), then there is no builtin SCSI support - it would be done via some kind of external board connected to the ACSI interface (that's the 19-pin connector at the back). So it's possible that it has failed. Can you determine what make of board is attached?

Where are you located? Maybe somebody could come to your site to do
diagnostic work.

You a host adaptor in order for the ST board to see the CD drive
as well as a driver. I use the Link II host adapter and Extendos
Gold as my driver.

Hey ya'll,
Picked up an Alldata System 3 and I am curious about the technical specifics of this system.
1. What dos version does this run in?
2. Does it have to run on a straight dos pc?
3. Can I change the cd-rom drive to a regular drive w/ no problems besides taking the disk out of the protective case?

Just curious which direction to go with this system.
Friend of mine uses it in his shop and my first thought was damn this thing looks old and outdated however; the cd's don't seem to be outdated at all.
Please help me out here guys.

I now find that this Alldata System 3 computer is running on an
Atari/ST and sofar I have it up and running but it does not see the
CD.
I have now replaced the Drive (toshiba scsi shuttle drive) and it
still does not see CD Rom?
Any help here?

you should look at some of the old atari groups using google. but you
do know that the peripherals have to be on _before_ powering the main
computer, right? try an atari cd, maybe the format is not the same?

Sorry, but System 3 is no longer supported. You either have one of the
old Atari machine or an early Pentium.Message 5 in thread

Actually the only one I ever took apart was a 386sx-25 ugh.. hard to believe we thought that was fast 10 Years ago. I think it used PC-DOS or DR-DOS rather than MS-DOS but it's been a long time.

Tim T.

Is there a list of Falcon compatible monitors? Is the falcon limited by the same HSCAN 15khz rate as the ST/STEs? Or is it possible to buy an off the shelf monitor and use it with the falcon, provided you have the svga adapter?

Thanks,

Sean

how is the cd rom drive connected to the computer? is there some kind of adapter that's between it, and the the 15pin hard drive port of the computer?

Can you bring up a directory of what's on the cdrom disks?

where are you located?

Off the shelf SVGA is the one to go for.
Standard Falcon resolutions are 640X480 VGA. Then there are the VGA compatable
ST compatiblity modes that you'll rarely ever use ;)

You only need those slow scan rates if you use the Atari RGB monitor block and
want true RGB ST Low and Medium resolutions. Even at that...you can use the ST
high mode with most bog standard VGA monitors provided you build the right
cable.

I don't know much about the new XGA TFT monitors, but I've heard some say these type monitors are a godsend on a Falcon...as they can correct flickers and such that anolgue CRT type monitors are prone to deliver when experimenting with not quite standard screen modes that a Falcon can do using software like Videlity, Blowup, or CentScreen. Some of these monitors are also designed to work as TV sets...so who knows...they just might jump down to those old RGB sync rates? At the least, you can also build a composite NTSC video cable for the Falcon if you ever want to mess with that kind of thing.

As for using an RGB monitor on the Falcon...unless you are really into trying to play ST/STe games or running RGB only demos and stuff...you'll never need it. If you do find yourself wanting to run something like that, it's not hard to build a composite out cable for the Falcon, or, just use the RF plug on the back with a run of the mill game system switch box (like came with the old Atari game consoles)with your TV set (quality isn't that good, but at least it works in most cases).

Hope this helps,
Brian

To All,

Is it possible to Hack "NEWSIE" resource file to cause it to send my
complete E-Mail

address to my NEWS SERVER when logging on (donw@intergate.com) ??

My ISP has changed their logon to the News authentication, from just (donw)
to (donw@intergate.com) and NEWSIE will only send everything left of
the (@) sign..

So I can do most everything on the Net with my TT30 except read the News :^(

Thanks, Donner...........

Unfortunately, the problem probably lies in the newsie code itself rather than the resource file. On a lighter note, efforts are being made to attain the Newsie source code though last I heard the original author isn't reachable.

Mark

hi! I hope you remember me, Boris Cahan, AKA Telvt,the guy who wrote Telnet
VT102. I have a bunch of Atari stuff, including a TT030 with 24 meg of RAM,
that I want to dispose of to someone who is willing to pick it up. I think
it would be a shame to throw it out. If you know anyone who might be
interested, could you let them (or me) know and contact me? Or tell me where
to post something? I don't want to pack anything myself, but have a lot of
stuff, still.
I am in Cleveland, Ohio, and can be contacted at
bdc2@po.cwru.edu

Newswatch will work with Newsie and that can send whatever you like as
authenication. You could use Popwatch as well, quite useful.

Hi,
    I wonder if any of the people can give me some advice about fixing a
floppy disk in a 520stfm.I have only just managed to get a couple of st
computers after about 8 years so a little rusty ;) Can it be replaced with a
PC floppy? ect any advice would help...

_James.

Not always true. For whatever reasons User Authentication doesn't work for me.
Newswatch returns me "authentication fails for user O"
I've tried everything I know but alas still no go. So I'm forced to use the pc  to
post messages.

CU,
Martin

even/odd, ie. every other byte.

In the pinatubo archive at
http://www.ccac.rwth-aachen.de/~michaels
is a tool called "rommix" that will do the job.

Hello Sean,

I would use HDDriver with your setup. Goto Uwe's site and download
the demo. I use in my STe setup that also uses a Link2 and
everything works fine.

Great... I am glad it worked. Last time I looked, there was alot
of nice ST files for Pacifist, that are just waiting to be
converted for true Atari ST users. Take care...

Were the disks that you are trying to read formated on the disk
drive you are using? If yes, then you may want to clean that
drive. Some disks that are formated on certains drives cannot be
read on other drives because of incompatiblies between drives.

The one that worked best on my wife's and friend's PC was
Pacifist. You can load in a number of TOS images, so that means
you can emulate anything from a ST to a TT excluding the Falcon
unless Pacifist has been upgraded.

Please would someone be kind enough to post or email the
standard AHDI Atari Hard disk drivers please.
Trying to keep a very old megafile 20 going with a slightly larger
than standard RLL drive.
thanks so much
Bryan

Not BS.  It needs Bus arbitration and THAT is the problem which isn't
supported by ICD software OR the link 2.  I don't particular appreciate
that attitude.  He probably would buy extendos if the scsi driver actually
detected the drive ;)

An excellent point. Make sure it isn't the power supply! Post if you
need instructions on how to test it.

The disks were either formatted or indeed used with the current internal drive and also my additional external drive.

I'm thinking that the disks must be damaged...

Thanks

Harry

Cool. Those big old arcade and pinball game machines still fetch a pretty
good price don't they? I remember seeing an old pinball machine sell for
```

$1000's at an auction a few years ago.

Regards,

Clockmeister.

If Roger Burrows is correct (and I think he is), the problem is that a CDRW can't be connected via a Link due to arbitration problems. A regular CD can certainly be connected with the Link (I've done it), and a CDR(W) can be connected to an Atari via other means (I've done that too), but are you sure you connected a fairly modern CDRW with a Link? If so, I'd be interested in knowing what model it is.

Uwe, if you are listening, can you add any clarification to this discussion?

Galen

Yep the pinball machines range from 500-5000.

The arcade games are actually starting to come down a bit in price. Usually they fetch 150-1500.

Hi Edward:

I purchased HDDRIVER 8 for my Falcon and really like it. I use it
with my Falcon and its external SCSI. When I tested it on my STE and
the Link2,
it was able to detect the external SCSI but not the Yamaha
CD-RW.

I believe what you are saying is that
host adapters like the Link2/Link97 do not provide
arbitration. CD-RW devices require arbitration.
So I could use my CD-RW obviously with my Falcon,
but not with a 1040STE + Link2/Link97.

I cannot really comment on CDRWs as I don't use one with my Atari. Fact is that any device that requires initiator identification (bus arbitration is more than that and is *not* provided by any LINK adapter, only initiator identification is) will only work with the LINK96/97 when connected to an ST/STE.

> I'm wondering if someone out there can help me.Does anyone know where I can beg/borrow or steal an Atari 1040STE emulator for my PC.I already have an Atari at home,but for reasons that will take to long to explain,suffice to say,its more convenient for me to find an emulator for my PC.

There are several Atari emulators, most of them free but some commercial, and one of them may suit your need better than others. Do you really need STE emulation or would ST emulation suffice? Do you need 68020 emlation? Do you intend to launch it from Linux, Windows, or, perhaps DOS? Will the computer be dedicated to running the emulator only? Do you intend to work in monochrome or need colour display? Do you need extended screen resolutions (e.g. like 1024x768)? Do you want to use mostly decent GEM applications or dirty-programmed ones like games? Do you need it especially to run some particular application(s)? That would all be the issues which may be relevant in deciding which emulator would be the best to use. You would have to investigate a little.

When searching, look for names like PaCifiST, TosBox, Gemulator, STeem, STonX, SainT, AranyM, MagicPC; most of them, with their relative merits and drawbacks, have been mentioned and discussed in the AtariST-related newsgroups. The free emulators can be easily found on the 'net, and if you have problems finding one, I am sure someone will point you in the right direction.

Btw. for any emulator you would need a TOS "image" file- there are utilities for extracting one from a ROM in your real Atari, or they can be easily found on the 'net (the legality of that is rather dubious). For most serious work it would be best to use an image of TOS 2.06, but for AranyM you may want a certain variant of TOS 4.*.

(BBtw. there have been discussions whether AranyM is an emulator or something else (more like a software-realized PC-hardware-based Atari clone), but this is not very relevant for your search)

Hi Djordje,

> Btw. for any emulator you would need a TOS "image" file

No, for MagiCPC you don't need a TOS-image, the TOS (Magic) is
included. But MagiCPC is a commercial product.

Is there anyone who could help me with the following:

The mouse of my Atari 1040 ST does not work properly anymore. The mousepointer does not work, and doubleclicking only works after several clicks. I tried an other mouse but this one has the same problem. So, the problem must lie within the ST. I heard of loose mouse contacts in a newsgroup, so I want to open my ST and try to solve (solder) the problem. I opened the ST, and now I do not know what to do with the 28 tiny screws at the back of the keyboard print panel where at the back of it are the mouse contacts, I presume. Can I loosen them? Is this the right way?

Thanks for your help!

It is probably on it's last leg. I would just get a new one or
else try cleaning it. You can get a serial mouse adapter that will
let you use most any PC mouse with your ST. Works great for me.

Thanks! Ed,

Works great on the STTOMSA side!
No problems creating an MSA.
BUT
When I transfer files from a Win98SE machine to a 720K Atari formatted
disk, the disks become "damaged" when I try to run the program on the
Atari.
I've had this problem ever since upgrading from 95.

Any ideas?

Hello,

I have a Zubair Z-RAM 3-D/4MEG upgrade card that needs RAM.
The box states:

Z-RAM will work with 1 MEG chips 120ns or even 150ns speed.

Anyone know of a source for these???

```

I recently recieved an SMP 24 that I purchased from the UK. I'm in the US. The back of this thing seems to illustrate that it will work with 110 or 220 v by only changing a fuse and the cord. I can't seem to find any switch or anything on or in the unit. I only noticed a yellow wire left unplugged, and nothing attached to what here in the US tends to be the ground pin.

Powering up causes the little cricket speaker inside the thing to just whirrrrrrrrrr as the number read-out flickers.

Do I have to change the powersupply? Cross some wires?

Any help would be muchly appreciated.

Thanks,
Brian

Hi.

The same box is used for the 220V and 110V models.
I opened mine and had a look; sometimes it is only a matter of moving a couple of wires. (I did this to my 110V Roland D50)

Open your unit and have a look at the area between the transformer and the fuse. There are 6 of solder points connected to various points in the power supply. There is a jumper between two of them.

It looks something like this: : I :

I am not sure, but you could perhaps try to remove this jumper and solder new ones on the unused places.

Like this: I : I

Of course, this may cause the whole thing to blow up as I haven't tested it.
I take no responsibility for this at all. Try it at your own risk.

-- Peter

I recently bought one of these from Germany, and I live in the UK. I wondered the same (and the instruction manual was in German, so that wasnt going to tell me) So I just plugged it in and it worked.

I don't know what power supply they have in germany, but it was a two pin plug so I had to change that, but when I checked the fuse on the back, the right was in.

Hope this helps....   Rob

Probably not. Most of Europe use something between 220 and 240V 50Hz AC
I believe the USA uses 110V or 120V or something like that.

The transformers in most small PSUs are built to be used with both
systems. Usually the primary winding has a centre tap for use with
120V. The outer tap is used with 240V. If you have no idea what I am
talking about then don't attempt to make any changes to PSU's

In Britain 240V has been the Standard (captital S) for a very long time
but the EEC tried to standardise things. The BS standard was 240V +/-
a very small amount, I think it was 5V or 5%. Unfortunately the French
could only manage 220V +/-10% so that became the standard.

I could tell you the 3-pin plug story but I am all ready well Off Topic
so I'll go back to sleep.

Regards,

Peter

I don't know about the US, but in Canada electric clothes dryers
and electric stoves run off 220v. Everything else runs on 110v.
(I'm pretty sure that the three main electric cables that come into
the home are 220v @ 60Hz and that these are split up into 2 110v
supply ciruits; I could be wrong, though...)

If the same situation exists in the US, this information might be
helpful. You'd best ask an electrician.

Hope this helps,

Randy Kwak

I have finally succeeded in creating a Unix partition !
I now have an EXT2FS partition on G: but when I open
the partition in Thing it gives me a warning about mounting
an unchecked device and asks me to run another program to
check it. This cannot be normal but hopefully should be
easy to fix. Any ideas ?

I need to work out what to do next to create the full Mint
installation without breaking my Mint/GEM environment.

Peter

An alternative is available, 2 x 720k disks, ask for that.

Tried this and it seems to work now...at least the buzzer just beeps once right
when powering up.

Connected to a Falcon:
The display reads .8.8.8.8. all the way across, but CAF apparently can't see the
device. I've enabled SMP4.DRV in the MROS folder of CAF and launched it.
Anything concerning the SMP 24 is 'grayed out' and can't be selected.

What next?

Thanks,
Brian

Not sure. Start the unit without connecting it to the computer.
The buzzer should sound Beeep Bip Bip Bip (Long-short-short-short) and the
display should show a scrolling message.

I know this one, for the SMP24 to work, it needs to have version 1.6
software (for the SMP, not cubase), it tells you this in the cubase 3
manual, if you have it.
Though mine came with a german manual, there was a piece of paper
attached saying that it had been updated.

What you'd do about it these days being updated, I don't know.

The ROM chip thinggy has a sticker marked 1.65.
I get the one long beep, but not 3 short ones.
This is with or without it being connected to a computer.

What TOS does your Atari have? I have a STe and can format disks on it, insert it in my wife's PC. put files on it and then put it back into my STe and get those files with no problems. If you have a TOS that is less than 1.4, you will need a formatting program for the Atari that will put a PC boot sector on the disk. I have one somewhere. Email me if you need it.

I get the same thing when I bring up a EXT2FS parition when I do not go through the normal boot up for Mint/MintNet. In Other words, I would have to boot the computer from a EXT2FS partition using FreeMint, then the warning does not appear. But if I boot the computer from a GEM parition and have it also load in Mint (so I can use the ext2 driver), I get the warning when I open the EXT2FS parition. I do this when something is wrong with the EXT2FS partiton and I just need to check it.

Can you still move the mouse pointer using the keyboard??? Have
you tried using your mouse with nothing else installed in memory?

When I switch mine on, I get a scrolling   "SMP 24   1.6"

Do you get this, if so, I've attached the version of MROS that worked
for me, I've also attached the contents of the disk I also got with
it, in case any of it is any use. There is an english read me file
that may help you.
If your's is version 1.49 instead of 1.6, then it won't be MROS
compatible (but see the read me for details.)

"Rob" wrote
> When I switch mine on, I get a scrolling   "SMP 24   1.6"

I don't get any sensable message when I power the unit on.
Instead:
It beeps one long chirp and displays something like:
.8.8.8.8.8.8.8. (filling up all of the LED's).

None of the small LED's around the buttons light or flash (I.E. smpte lock)

Now I'm wondering if there is some way to tell the unit to reset itself/initalize, or if it's something the SMP does each time it powers up anyway. I.E. Most of my synths have some button combo you press when powering up that will clear any memory, reset everything to factory status, and run internal checks, etc...

I've checked for loose wires or chips and there are no visible problems, tho' on the bottom side of the board, some of the lacqure is a bit flakey from heat/age etc.
All of the PCB tracks, at least those visible to the eye seem solid enough.

The one chip that looks like it may be some sort of EPROM has a yellow sticker on it and is labled by hand 1.65.

For some reason or another...the unit isn't initalizing and booting up correctly.
Any ideas about what to check next would be very welcome. Or..if anyone knows a good place to send such a thing for repairs that would be nice to know as well.
I'm thinking Steinberg Germany would likely be more helpful than they will here in the US, but my German is nadda. If Steinberg won't help, there's the possiblity that the company that made the things (Waldorf) might be able to service it....again, I'd need a German friend to help me communicate with them?

> compatible (but see the read me for details.)

Thanks much for the attachments Rob!
I'm sure I'll need these if/when I can get the thing to boot properly.

Thanks,
Brian

Great news!
Thanks to the info Rob sent, I discovered how to initalize the unit, with some luck it should work now...on my way to test it out with the Falcon.

Thanks!
Brian

Hello Atari heads. It's been awhile. I still use my stacy extensively for midi sequencing but the keyboard is starting to go. I have replaced a few of the rubber "springs" with real springs but now some of the connections are starting to fail and I see no solution other than a new keyboard, or at least a new circuit sheet (I don't know the correct term).

Any suggestions?

Kerry

Hi

I have in my TT a GE Soft Mighty Mic 32B TT ram board populated with
8 1Mb 30 pin memory strips.

Is it possible to upgrade to 16 or 32 Mb? (If I could find the chips somewhere ;-)

Current population is:
4 IBM B1A1090BA-70
4 SAMSUNG KMM591000BN-7 9232 SEC

What should be type numbers of 4Mb strips.

There are also 3 jumpers currently set:
--. j0
.-- j1
.-- j2

Are those settings of a particular interest?

The board was second hand, it didnt came with doc's

Thanks in advance

--

I didn't think this was possible. I thought Mint had to load before
the XFS driver and so it had to boot from a GEM partition.

Oddly, the message has gone away.

I am now trying to install EasyMint but it doesn't work with RAW
partitions. Marc-Anton Kehr says EasyMint >= 1.4 only supports LNX
partitions. I have tried setting the partition to LNX but then
mkext2fs doesn't recognise the partition as LNX, it thinks it is BGM.

I'm using HD-Driver 7.71.

check that you've set arp on the Windows machine.
see arp.exe
An example of how to do this automatically...
make a text file called arp.bat on your PC that contains the following line:

```
arp.exe -s     ip.addy.of.your.falcon     mac-address-of-the-dynalink
```

Next, make a shortcut of this bat file and drag it to the windows start-up folder.

I'm assumeing this is a direct connection to your PC? No hub or switcher?

If you have a firewall running on your windows PC...make sure the Falcon's IP address is in your trusted/local zone.

Be sure the subnet address is correct.

Be sure that the gateway you have set in the STing ROUTE.TAB is correct. If you are wanting your ethernet port to be the default route, then you'll want this to be the last line in the ROUTE.TAB file (use a text editor to edit).

If your PC is called 192.168.0.1 on your lan, and your PC then connects to the internet, then that 'should' work as the gateway. Double check that your PC is indeed given said ip-address. I.E.

```
0.0.0.0    0.0.0.0    Ethernet0 192.168.0.1
```

You might also try with a simple default routing of:

```
0.0.0.0     0.0.0.0    Ethernet0    0.0.0.0
```

This one simple default routing is usually all one needs unless you're using more than one port with STing. You can still 'dial out' if needed, because the dialer always sets a default route to the modem port in use.

Finally, in the STing ports.cpx, be sure you've given the Falcon an ip-address.

A DNS server is important. If you get 'can't resolve host name' messages when using your PC as the DNS/gateway, then find out what your ISP's DNS server is, and enter that.

Hope this helps,
Brian

Has anybody built a TOS switcher for an STE. I have installed tos 2.06 and 1.62 by soldering 1 chip on the other and using a spst switch on CE and a couple of pull up resistor's. It appears to be OK till you run sysinfo, and/or gem bench all I get is a Bus error (2 bombs). Any ideas fellers?

Mark

Hi Mark,

If it boots in TOS 1.62 and TOS 2.06 then I imagine you've done it all right. Maybe a dry joint somehwere, do other programs boot OK? Where does Gembench fail?

As soon as it starts to kick in. Sysinfo produces a tos 35 error in 1.62 and
resets itself under tos 2.06. Sppoky.

Mark

Hi,

I saw the schematics of the ROM port-Parallel port adapter on

http://users.otenet.gr/~papval/ethernet.htm

and

http://www.asamnet.de/~hilgarte/ether_e.php

and I noticed something weird. The diagram says that ROMPort 21
(A8) should be linked to pin 8 of the lower LS374, whereas on the PCB
it's ROMPort 22 (A14) that is linked to that pin.
Did anyone notice already that?
Does anyone know which is wrong (diagram or PCB)?
TIA

Serge

MB> tos 35

-------------------------------cut---------------------------------
TOS Error #35, probably the most common error alert that is not self
explanatory, happens when a program you are trying to run has somehow
been corrupted. What it means is that TOS can not find some magic
numbers it expects to find either at the beginning or at the end of
the program file. This error is usually attributable to operator error
(as in trying to execute an archive or text file as a program), or to
bit rot.

Got 2.06 working ok. But, booting a clean system off a blank floppy, then running sysinfo or the like under tos 1.62 I get either 2 bombs or error 35. I suspect the error 35 is a red hearing. It can occur when a disk is write protected and needs to write to the drive also (maybe a dodgey disk as using 1.44 disks to test). My though was that one of the 1.62 chips was a bit flakey, will attempt a re-write to a couple of new roms and see how it shapes up.

Hi,

Sounds like bus contention.  Check ROMs are not conflicting together
with their OE pins.  If you piggybacked make sure the ROMs you used
have the pinout that allows you to do this.  Check for solder wiskers.
 Easiest way to do this I think is use one larger ROM and switch the
Address line. Check Vezzs site.

Can you clarify a little more what exactly did you do? Do I understand correctly that you installed a second set of EPROMs on top of the original one, interrupted the CE signal, conducted it to a switch at (probably) the back of the computer and led it to CE pins on the EPROMs? In my opinion guiding these signals all over the box through (probably) long wires and a mechanical switch of unklnown (large) parasitic capacitance is not a very good thing to do- try to make the wires as short as possible, and also try ty make the switch indirect- use a 1:2 demultiplexer switch (can even be a simple 74**00 chip) located near the EPROMs and lead the static mux-switch signal to the mechanical switch at the back of the box.

On another approach, is the DMA chip in your computer perhaps a part with marking CO25913-38 PH23-030 ? I had problems with that chip (data corruption when reading/writing disks) in a MegaST when I tried to add too many things (additional EPROMs among them) on the data bus. Removing ANY of the items on the data bus helped a bit, as well as changing the EPROMs to some by other manufacturer. Adding a large (1uF- NOT electrolytic) decoupling capacitor immediately next to the DMA chip helped too, and you may also try additional (thicker) ground and +5V from near the power supply to the DMA chip. The same (need for additional decoupling and better ground could be true for the EPROMs).

Note that by this time your disks (the ones from which you try to launch
some applications) may be corrupted by the improperly-working machine.
Create new disks for testing and write-protect them.

I have an Alldata System 3 Computer for automotive service manual and
we have problems.
This runs on an Atari/ST board and has a scsi cdrom shuttle however
the system does not see the the cdrom.
I have change the drive with no help from that.
Guy's I dont really know what direction to go and have never worked on
an Atari.
Any Suggestions on this problem?

Is there anything else connected to the SCSI interface?
Have you checked the Shuttle out on another system, e.g. PC with SCSI card?

Not sure what you mean by a "shuttle" - please explain.

>I have change the drive with no help from that.

If it's really an ST board (as opposed to say a TT or a Falcon board), then there is no builtin SCSI support - it would be done via some kind of external board connected to the ACSI interface (that's the 19-pin connector at the back). So it's possible that it has failed. Can you determine what make of board is attached?

Roger

Hallo,

ist es m�glich bzw. hat es schon 'mal jemand gemacht, den ATARI ST als MIDI-Interface bzw. -Controller einzusetzen?

Ich �berlege, ob ich eine zweimanualige Orgel mit Pedal mit einem kompletten MIDI-Interface ausr�sten mu�, oder ob man die M�glichkeit hat, ein relativ einfaches Interface zu bauen, das dann an den Parallel-Port (zum Beispiel) des ATARI geht, und der ATARI erzeugt die eigentlichen MIDI-Befehle.

Die Orgel soll anschlagdynamische Tasten (2x61 Tasten + 30 Pedal) bekommen durch die Umr�stung. Es ist wichtig, da� alle Manuale und auch das Pedal anschlagdynamisch sind. Ich m�chte keine zwei bis drei Interfaces einsetzen, deren MIDI-Daten zum Schlu� gemerged werden, es soll alles "aus einem Gu�" sein.

Gegen�ber einer "reinen" Interfacel�sung verspreche ich mir vom ATARI eine flexiblere Programmierbarkeit.

Ich w�re sehr dankbar f�r jeden Tip, der mir weiterhelfen k�nnte.

Viele Gr��e,
Lutz.

You a host adaptor in order for the ST board to see the CD drive as well as a driver. I use the Link II host adapter and Extendos Gold as my driver.

Subject: ATARI-ST as MIDI-Controller

Hallo,

Is it possible, or has someone already done it before, to use an ATARI ST as a MIDI-interface or -controller?

I am wondering if I have to fit a complete MIDI interface to a two-manual organ with pedals, or whether there is a possibility of building a relatively simple interface that is then connected to the parallel port of the ATARI, for instance, and the ATARI then generates the actual MIDI commands.

The organ should get touch-dynamic [?presumably velocity sensitive?] keys (2x61 keys + 30 pedal) from the conversion. It is important that all manuals and also the pedals are touch-dynamic. I don't want to use two to three interfaces whose MIDI data are finally merged - it should all be of a piece.

Compared to a "pure" interface solution I expect from the ATARI
more flexible programmability.

I would be grateful for any tips that would help me with this.

Greetings from
Lutz.

Hi "Bryan

There is no 'one way' of doing this modification so a blanket answer would be misleading, however, i think that most of these mods involve lifting a pin on the Floppy controler and cables being fitted at either end of the break that run off to a clock generator/switcher, this should be easy to spot and restore.

I suppose this would mean you have to constantly poll the parallel port
and whenever data is comming in from the actual device that is in contact
with the organ keyboard/pedal. Sounds a bit like when doing transfers
with PARCP between two computers via parallel port to me?

You will have to do a lot of programming to translate whatever comes in
on the parallel port to MIDI and then send the result out on the Atari

MIDI port.

I guess this would be possible but with lots of time critical programming in Assembler.

>Die Orgel soll anschlagdynamische Tasten (2x61 Tasten + 30 Pedal) bekommen

Whether you get "anschlagdynamik" (Velocity Sensitive keys) or not is completely up to the unit that you fit to the keyboard. A real organ has not that much "anschlagdynamik" to begin with so do you want the organ to sound like a piano or... :-)

>Gegen�ber einer "reinen" Interfacel�sung verspreche ich mir vom ATARI eine
>flexiblere Programmierbarkeit.

I guess there are devices that you can use to fit at the organ keyboard and that either puts the data out through a MIDI cable or some parallel port cable to be connected to a pc?

If you are a very good Atari programmer you might be able to write a program that converts the parallel input to MIDI data if you have the full specification on the signals this device produces.

On the other hand if the device can produce MIDI data all by itself you could easily merge all three(?) MIDI outs and probably get better timing with much less effort. There are also MIDI expanders for Atari and soundcards for pc With more than one MIDI In connector if timing is critical and you get to much data to be handled by one single MIDI cable.

Maybe you have a device that can't transmit Velocity Sensitivity in any way? If so you are out of luck as the actual device that you mount on the organ must be able to detect the key velocity in the first place.

In trying to figure out why a piece of hardware works on some TTs and not others, I suspected that the motherboard rev level might have something to do with it. So I foolishly decided to check mine.

The first one I opened (an older one, but after the 16-32MHz daughterboard stuff) does not have it marked. It has the silkscreened space for the rev level towards the middle of the board, rather than at the lower right hand corner (which is where the later ones have it I believe), but no rev level is actually marked.

Can anyone identify the rev level from that description, or tell me what to look for (perhaps from chip numbers or locations) or (even better) point me to a summary somewhere?

Thanking the experts in advance,
Roger Burrows

I am not an expert, but I do have a Field Service Manual, and as a guess, what you have may be a Rev 0. I have a sheet in that manual marked "not mine" in pencil. It has a date of 1990, and appears incomplete in a number of areas, and uses chip formats, or at least arrangements, not found in later machines.

That drawing does not even have a title block.

The drawing that looks complete has a date of May 16, 1991, and a list of country codes, and instructions on what to put on that line, which is now at the lower right hand corner.

From what I have, it seems that there were some undocumented revision levels between a date uncertain in 1990 and May 1991. After May, 1991, one might find marked revision letters.

But rather than changing the silkscreening, some revisions were marked on paper stickers, along with new part numbers. One I have and am looking at has a part number of CA401146-001, Revision H. The part number on the silkscreening is CA400770.

It has two production cut-and-jumper paths.

So far, there seem to be 1990 machines without rev level or country code, and May 1991 and later machines with rev levels and country codes, and new part numbers.

I do hope someone has better information.

Jim

Anyone one wanting to retro fit their Atari with wireless ethernet
should have a look at these:

D-link DWL-810 ethernet-to-wireless bridge
This unit is capable of roaming.
This unit is actually designed to retro fit any standard wired device to
be wireless.

D-link DWL-900AP+ wireless access point
This unit cannot roam.
Can be configured as a wireless client like the 810.
Actually has several modes depending on what you want to do,
you can also configure this as a wireless access point
plug it into your old wired router, then wireless devices
can connect. Niffty. ;-)

Both units have web based setup tools built in, so all you
need to configure then is a java enabled browser.
I've tested both units. My Hades went wireless with the 900

and the TT will hopefully soon be wireless via the 810.

Hi all,

My STE suddenly can't see my SCSI drive. Cables all seem to be OK. Tried
cable and adaptor on my Stacy too. It can't see it either.

Any ideas on confirming the adaptor is dead or fixing it?

Richard B.

Richard,

What do you mean by 'see'? Assuming you are using ICD drivers, does
the HD show up during the bootup screen?

No, it doesn't show up on the boot up screen. The STE or Stacy can't
detect/see it.

Hope that's a bit clearer.

RB.

What I think was meant is, do you see the ICD banner and drive details as the machine attempts to boot?

Have you tried running the boot prog from floppy?

All the common boot progs, AHDI, HDdriver and ICD etc, put some sort of banner/info on the screen.

Is the red LED on the Link II lit?

You also ask about your monitor, did this problem show up at the same time?

Send the Link in and I'll test it.

Barrie at Keychange.   www.keychange.co.uk

I have a Mega ST2 and would like to connect either a hard drive or a scsi zip drive to the unit.

I had an old sh204 but it died and I don�t know how to replace the hard drive in it.
I tried using another quantum, 1 gig but it didn�t even see it.

Thanks!

> the machine attempts to boot?

With the drive connected to my Stacy via the Link II, I see the ICD banner on boot which displays the internal SCSI drive but not the extenal drive which it used to.

> Have you tried running the boot prog from floppy?

From STE and Stacy. Niether see external SCSI drive via Link II

> All the common boot progs, AHDI, HDdriver and ICD etc, put some sort of
> banner/info on the screen.
>
> Is the red LED on the Link II lit?

LED is lit

> You also ask about your monitor, did this problem show up at the same
time?

No the drive failed first.

> Send the Link in and I'll test it.

Will contact you shortly. Thanks.

Richard Ballinger.

I think Link II takes power from termpower pin on your scsi drive.
Tryed with another scsi device with termpower on?

Thierry

Hi there!

My wife uses a 4 MB STFM for word-processing using 1st Word Plus. (Yes, I know it's old, but it's simple and sufficient for her needs. I have set it up so that she only has to insert a boot disk which installs a 350 kB RAM-disk, copies all 1WP program files to it and runs the program automatically, opening up a file selector on drive B: for the data disk. That way she need not keep on changing disks, as the program files are constantly available.)

Anyway, normally this works fine, but last night a strange bug appeared: While she was typing, the keyboard and mouse suddenly froze and the cusor moved down below the last line and kept on blinking at a rapid rate. Occasionally, the longish text would jump to the top and then scroll down in the window automatically, ending with the blinking cursor at the bottom again. Nothing I could do could break this loop; I couldn't save or quit and had to switch off and reboot. Luckily she had saved relatively recently so not too much work was lost.

But what could have been the cause of this bug? It appears to me that the keyboard processor got stuck in a loop, possibly due to some overflow. Is that possible? I don't know what she typed just before this happened.

Come to think of it, I remember something similar happening to me on my STFM some years back. Never got down to finding the reason.

Any ideas?

Regards, /Peter/

I have been given to believe (waffle words) that it is a bug in the TOS keyboard handler routine, and with the amount of typing I did, it bit me often. It is said that this part of TOS has been patched by several programs, one of which being NVDI.

Atari put a little program on a developers disk, and somehow I got a copy, and probably posted it somewhere. Maybe it helped me in this area, and maybe it did not, but it is "ovfix1.prg" and it is 351 bytes long, and it goes in your auto folder. I think I stuck a copy on the umich atari archives sometime in the distant past.

Or you may have found a new bug. What it did to me was repeat what I had typed, and finally lock up, and was called the Ghost Typist problem.

If ovfix1 does not help, is there room for NVDI on the disk?

BTW, all my text stuff is done in 1st Word Plus on a TT030 with 128megs of memory. And, I have not met that bug recently. It used to strike after I had been typing for an hour or so.

Jim

I've never heard of Link II failing, but I suppose it is possible.
I'd take up Barrie on his offer, but I'd also check the cable as I've
had a couple fail on systems that were not moved or altered in any
way. I know it sounds strange, but a new cable got it working again.

Yes it is MFM in the SH204. Those MFM drives typically go from 5 megs up to about 80 megs. Those drives can be perticularly confusing since they can appear identical to an RLL or EDSI drive. But none of those types are interchangable (despite what the rumours say). Finding out if a perticular drive is MFM or one of the other types is usually easiest by checking the model number. like on old Seagate drives (like atari used) the model number is ST-xxx for mfm, ST-xxxR for RLL and so on where xxx is a number usually.

Ok, so if you see my previous post [how do I make my SCSi always appear], you may see I couldnt get my external drive icons to always stay on the desktop.I decided that I would back up the entire contents of drive C to the new external Scsi drive I had (so I at least always had a copy) and then would format drive C and start over. [the reason for this was that there was it was a 2nd hand falcon, and there was a lot of software on there that I didn't know how to use, and didn't really know what it was (though I've backed it up anyway).

When I turned the computer back on, it booted up to a horrible resolution with only A + B drive icons and the trash icon. Having dug out my HDDriver disk (version 8, though I do also have v7.8) I managed to work out how to install the internal 6gig IDE drive.

I played about with the desktop resolutions, drive icons, colour etc and was able to save the desktop. I couldn't seem to get the external drives to appear though, and tried playing about on HDDriver a little more, and I was able to get them recognised in the program (though I obviously didnt want to partition them as I have the old contents of old C still on one of the three partitions.)

Going back to the desktop and even restarting didnt make a difference, I couldnt get the external Scsi drive to appear (though I could get the zip to appear, and the scsi h/drive was connected to that).

I found what I thooought to be a scsi driver in an auto folder on the hddriver 7.8 disk, and so put that in the autofolder on c drive, only now, when I turn the computer on, I can't get it to load to the desktop, it goes through the memory count, but then seems to just reload the same driver until it bombs out.

putting a disk in A drive doesnt force the computer to load that first, is that correct, or do I need to do something else to force the floppy to boot before the hard drive, and get me to the desktop so I can remove the two files I put in (both .prg's)

Thanks if anyone can help me out.... Rob

Interestingly enough, I run into this crap all the time. Usually though the keyboard processor crashed or gets an error. The behavior of the keyboard processor when it gets an error usually is to press the ESC key repeatedly until you switch active progs or something else changes keyboard processor code. Anyway.. I am always having strage problems like that and it's amplified by my recent purchase of the EtherNEC which seems to cause random mouse movements and keyboard presses of the number 1 while downloading fast. annoying. Though now that I think about it.. attempting to use different ethernec drivers might help out. I chose the one driver that ozk sent me that got the highest throughput. maybe it checks for errors a little less and randomly writes to the keyboard or something ;)

Actually inside my Megafile 30, I replaced the MFM drive with a 190 meg
maxtor RLL drive.

Mark,,

Thats exactly what I meant about the mfm / rll / esdi drives being confusing. no megafile 30 ever had mfm drives, atari used the seagate st-238r which was exclusively RLL, I know for a fact since I replaced one last year with another of the same drive mech.   Btw, RLL drives had a maximum capacity of 120megs (mfm were 80megs tops), Of the 3 times that appeared to be the same (but arent) esdi is the only one that could be 190megs or larger.

I accidently deleted the desktop.inf file and when I double click on supraboot.prg, I can install four of my five drives (d:, e:, f:, and g:) but when I try to install C:, I get 'Cartridge' at as the description with 0 bytes. I can access my other drives but not C:

Any ideas?

Thanks

was that easy to do? did you have to change any dip switches on the
megafiles board?

Type an uppercase "C" for C:

Typing a lowercase "c" is for the cartridge.

;-)

Stuff like this amazes me, you know lp, if it were not for this newsgroup, I would have tore my (remaining hair) out trying to figure this out. I dont' think any google search would have revealed that one....

Thanks a bunch!!!

What is the easiest printer I can get hold of today to work with my ST?. It is getting harder to get dot matrix printers. Would a standard bubble jet in epson compatibility mode work? Are there any drivers that would make my life easier?

Thanks...

P.S
I have a canon bjc-2100. Could I hook it up via the parallel port ?

Assuming the ST parallel port is the same as a PC albeit not ecc etc

The best option is the NVDI package, it accelorates screen redraws/text
displays plus adds support for many printers, Epson, HP, inkjects and such.
It's worth every penny in my opinion, and installed on all my machines.
You also get scalable vector fonts, true-tyoe support and such too, it's
really nice.

No, not really. In any case mine's only licensed for one machine.

As it's so small, any chance of emailing me ovfix1.prg please and
I'll try that?

Regards, /Peter/

Sounds like you are trying a lower-case 'c' - that is indeed the
cartridge. Try installing a capital 'C' and it should work

I managed to get this to work. I converted to .MSA and then extracted them via a windows based program. I am at home right now and forget the program name (I am a travelling consultant whose Atari machine is what keeps me sane during the week)

I can post the info when I get back to my *other* home Jan 6th

You may try the free German news service news.cis.dfn.de . Very reliable
service. You will have to register first and get your password. Works
perfectly with Newswatch.

I retrieve all my news from then but I post via my local ISP server
because of:

1. Crappy local ISP newsfeed.

2. Local newsgroups that news.cis.dfn.de does not know of and it's
   difficult to have Okami/Newswatch to post via different servers.

[Some may also notice that pc OE is not the ideal newsreader...]

Ok thanks, I'll give it a try. I surely like Okami. Sofar I haven't found
any Mac/pc reader which comes near Okami. What I dislike the most of the
(most) Mac/pc readers is the all-in-one-window concept. On Mac side I
found a reader which please me a little bit, MacSoup. On pc side
curruntly I'm testing out two readers, Fort� Agent and Xnews. Xnews is
the one which I prefer, because the not-all-in-one-window concept. It
requires quite some reading (like Okami) before one get the most out of
it but once set-up properly it's a very powerfull reader.

> 2. Local newsgroups that news.cis.dfn.de does not know of and it's
>   difficult to have Okami/Newswatch to post via different servers.

Hmm, never tried it out myself but a multi user setup wouldn't this be a
solution to post to different servers. For Newswatch one have to have two
different setup files. I'm forced to to that because my ISP has two
different newsserver, one for text and one for binairies. nntp.dat is for
the text server and nntp-bin.dat is for the binairies. All I've to do is
rename nntp.dat into nntp.da and nntp-bin.dat inot nntp.dat. Not very
comfortable but it works.
I wished Gary Priest, the programmer of Popwatch and Newswatch would
release the source of both programs so others could take over the
developement of those nice and very usuable prg's. Implementing the use
of different setups in Newswatch wouldn't be that difficult I guess.

>
> [Some may also notice that pc OE is not the ideal newsreader...]

OE (and Mozilla/Netscape) is certainly not the ideal newsreader. Thanks
to OE and family lots of posts are hard to read because OE fails
(sometimes) to rewrap text properly at reply.

CU,
Martin

I have done it before. I have a program (for a PC) that converts a
ST file to a MSA file. Then I have a program for the Atari ST
that converts the MSA file to a regular ST disk. If you want the
programs email me...

Hello James,

Yes, any PC floppy can be used. I replaced a floppy drive in a
friends ST using a floppy that was labeled PC only. I only had to
change the jumpers on the drive, then it worked perfectly.

Hello Donner,

I never had that problem with Newsie when I used it. What version
are you using? I would switch to Okami anyway as it is more upto
date. Newsie used to crash on my Hades, but I have not had any
problems under Okami.

I think a multiuser Okami will be no good in this situtation? Most likely all outgoing posts will end up int the same spool folder anyway.

>different setup files. I'm forced to to that because my ISP has two
>different newsserver, one for text and one for binairies. nntp.dat is for
>the text server and nntp-bin.dat is for the binairies. All I've to do is

>comfortable but it works.

You can solve this much more elegant as Newswatch reads the command line on startup and also VA-start messages when already running.

Simply put the the .DAT files on the desktop and drop them on the Newswatch window or program icon.

Another even better method is to let Newswatch run in batch mode. Here I have a desktop icon that reads "send & receive news". When doubleclicked first outgoing news is sent to my local isp, then new articles are fetched from my local isp and the German server, all in one go. Very practical. You should do some reading in the Newswatch manual...

Can be done in Neodesk or Jinnee without any extra help apps.

In Jinnee first create a symbolic link to NWATCH.PRG and call it something else like NEWS_BAT.PRG . Now make the link an "Installed application" and set Jinnee to feed it with the command line:

```
/uTEL_NNTP.DAT /p /r /uDFN_NNTP.DAT /r /q
```

or similair on startup. Finally drag a copy of NEWS_BAT.PRG icon to the desktop and rename it to anything you like. Now use different *.DAT files for each server. You can however only use _one_ server that requires authentication as the file AUTHINFO.DAT is shared by all servers.

In Neodesk the approach is somewhat different to get the same result and no symbolic links are needed.

>I wished Gary Priest, the programmer of Popwatch and Newswatch would
>release the source of both programs so others could take over the

>of different setups in Newswatch wouldn't be that difficult I guess.

Agreed, but this feature is already there...

Popwatch on the other hand suffers from some buffer overflow problems when some very nasty spam mails loads, complete text in one mega long line.

>> [Some may also notice that pc OE is not the ideal newsreader...]

```
>
>OE (and Mozilla/Netscape) is certainly not the ideal newsreader. Thanks
>to OE and family lots of posts are hard to read because OE fails
>(sometimes) to rewrap text properly at reply.

Actually OE may have severe problems to view my posts at all at the
moment. I have not got any complaints about "empty posts" yet but they
sure will appear sooner or later.

MacSoup users still complains about "too long lines". When you have
switched back to Okami this problem will go away unnoticed.

Hmm, maybe. As said I never have tried this.

I one of those who (almost) never read a manual. I read it a few minutes
ago and I must agree there are some interesting things to read. I think
I'll be busy the next few days.

>>I wished Gary Priest, the programmer of Popwatch and Newswatch would

After reading the manual I know better now. But things would be much
easier if one could choose the newsserver from Newswatch.

>
> Popwatch on the other hand suffers from some buffer overflow problems

Hmm, I never have had any probs with Popwatch. I do receive some 10 Spam
mails daily (most of then Korean). I delete then via Popwatch. A very

handy option.
>
> MacSoup users still complains about "too long lines". When you have

I can't recall me any too long lines. I'm using one of the latest betaversion (v 2.5b for Mac OS Classic I believe).

TTFN,
Martin

Hey, if you don't want to use the only still supported hddriver, then use AHDI, it's free of charge. But the HDDriver has much more features and supports also big and modern hddrives.

> There is no place for you in modern world. Bye bye.

So you shouldn't earn money for your work too!

I've had some trouble with an ICD FA*ST external drive.
Sometimes when I power it on, in combination with my
1040 STE it boots up. Other times, when I power it on,
I hear a 'clik' and it doesn't boot. When it doesn't boot
I've run the ICD utilities from the A drive of my STE and
I can detect the drive, it just can't see the partitions anymore.

Has anyone else had some trouble with booting from ICD FA*ST
drives? It has an 80MB Quantum SCSI inside. Should I look
at replacing the driver, or is it a problem with the host adapter
in the ICD FA*ST box? If I do look at replacing the drive, I
imagine I'd have to shop for a used RLL type SCSCI to work with it.

Sean

You need to get a PC floppy drive which can have it's drive ID set to 0,
instead of the PC's default of ID 1. Many, but not all PC drives support
this - older drives typically are more likely to have this jumper, since
leaving it out is another basic cost-cutting measure :-)

It sounds like the drive has started to get "tired" and is not spinning up to speed on power on. This usually gets worse until eventually it stops working all together.

> Has anyone else had some trouble with booting from ICD FA*ST
> drives? It has an 80MB Quantum SCSI inside. Should I look

I would almost certainly suspect the drive, and look at replacing it.

>or is it a problem with the host adapter
> in the ICD FA*ST box?

I doubt it very much its the ICD..

> If I do look at replacing the drive, I
> imagine I'd have to shop for a used RLL type SCSCI to work with it.
>

If its SCSI it matters not how the drive underneath is encoded. Drives that conform to the original SCSI I standard usually have a 50 pin connector. RLL and MFM have two connectors (I think one is 34 pin and the other 14 but don't quote me) so it should be easy to tell what type of drive it is.

What is important is what SCSI options the drive needs to work. I guess that like most Atari host adaptors the ICD does not do Parity and does not have a SCSI ID. If so you will need a drive that works in such a configuration, which may be hard to find these days. I have had some success with drives up to 1 Gig, but nothing over has worked for me.

Sean,

I have several of these Quantum drives, the TT030 came stock with Quantum drives of similar type. They fail, some of them fail sooner, some of them later but they definately have a history of failing for me. I do have one of them though that remains very nice and quiet and doesn't give me any problems. Best bet would be to just replace the scsi drive inside with a newer bigger one and cut your losses. You do have backups don't you? ;-)

The drive inside is probably just plain old SCSI-2. Not RLL or MFM or anything like that. You should be able to find use SCSI drives on ebay with the right 50 pin connector for $20 or less.

Mark

Hello.

Does anyone know where I can get the English docs and drivers for this card?

I have one in a Mega STE but no docs or drivers.

Any opinions as to how good it is?

Thanks,

Barrie at Keychange.   www.keychange.co.uk

Hi Barrie

NVDI 5 should support that card i believe.

Once you've had a graphics card in a mega you wont go back.

In the options, it's possible to set up a number of lines to be loaded
when one wishes to view a mail from within PopWatch: what if you set it
up to load zero lines?

Bye,
/Pascal/

Maybe but the phenomena appears when _connecting_ right before the
offending mail is displyed in the main window.

It's been some time now since I got any of these mails so maybe the bulk
email programmer has made his product better. The mail client presented
itself as "EVAMAIL 1.5".

Yeah yeah,

I have no information on this card, but I'll take it if you don't want it ;)
It's a good card. Probably best supported card on the atari (RT4000 chipset). Although the Nova on my TT works pretty well.

Barrie at Keychange <barrie@keychange.co.uk> wrote:

> Does anyone know where I can get the English docs and drivers for this card?

I *might* have some English docs and drivers for my Nova, I can take a look. You can also use either NDVI ET4000 or NVDI 5. These versions supports the Crazy Dots.

> Any opinions as to how good it is?

It's OK, although it will probably be a little slow on the MSTE. There is no hardware acceleration, so the poor 68000 will have to work pretty hard. On my TT it's acceptable, but not fast. The Nova is much faster, but very hard to find second hand for the TT/MSTE.

Hello,

I am glad it worked. I had too other gents request the programs,
so I emailed them to each. I feel I was lucky just to find the one
program that converted the ST files to MSA files.

I just received my registration for that German Newsserver. I must say

it works great indeed. Luckely only the German server needs
authentication for read/send. My ISP's newsserver needs auth. only for
sending out messages.

Now I wonder why auth. works with that German server but not with the
server of my ISP. Are there different methodes of auth?

Anyway many thanks. You've help me a lot.

CU

Would I be able to wire a second floppy disk to the Atari ST floppy port?

Would I need an invertor on the head-select pin?

Heres what i wrote up so far:
(PC being AT/ATX computer)

PC -> Atari

8	4
10	8 - DriveA
12	6 - 1
14	5 - 0
16	8 - DriveB
18	9
20	10
22	11
24	12
26	13
28	14
30	1
32	2 - Invert?
1-33	3+7

Pin 32 Floppy drive side is /SIDE1 when set high. Where AtariST floppy port
Pin 2 is /SIDE0 when outputting high?
Therefor inverting output on atari pin 2 will give me Low when Side0 is needed on floppy drive.

Is this different on the internal drive (PC Spec)? I put a HD floppy drive in due to old one being dead.

Thanks, Dan.

Ignore this pin - i think it'll interfere with the internal drive.

Thanks all for the help. It does indeed look to be the drive.
I opened the case of the ICD FA*ST and disconeccted the
Quantum SCSI from the adapter board. Even then it had trouble
spinning up. So I will be replacing the SCSI drive.

Thanks again,

Sean

I'm having trouble with my 520 STFM reading my older disks, these disks, like the machine have been sitting unused for possibly 8 years or so. As I initially thought that the internal drive could be at fault, I hooked up a second drive, which I know used to work also, but found the same errors. Corrupt data/Invalid disk I think...

Weird thing is that I also have some disks which contained DOS programs from the same time, and they can be read on my Win* machine without any issues.

Any comments and ideas on further testing would be greatly appreciated...

Thanks

Harry

Did you check the 5v and 12v?

The new drive will do the same again if the voltages are down.

Been there, got the T shirt.

Barrie at Keychange.

I want to burn TOS 2.06 onto new rom chips.

My 1040STFM has only 2 ROM chips and sockets.

Do I burn 2 identical ROM's or do I split into 2 files then burn each half?

What type of Eprom would I need? Modifications to ST?

Thanks :-)

Dan.

Ok, i did it - it worked first time.

Heres for those interested:

Floppy Disk Dr	> Atari Floppy Port
8	4
12	6 - 1
14	5 - 0
16	8 - DriveB
18	9
20	10
22	11
24	12

26	13
28	14
30	1
32	2

1-33	3+7

(I just connected any 2 ground pins of the floppy drive to atari floppy port 3+7)

I got power from internal floppy connnector.

The drives work back to back, reading, copying together (individually of course)

No inverters needed. (I personaly think that its a typo that got spread that atari Floppy port pin 2 is opposite of normal floppy drive pinout)

I had jumpers on the back of my floppy drives - external drive is set to '1' - internal set to '0'. If you have no jumpers on the external drive, try swapping pin 5 and 6 around on the atari floppy port pins (thats 12 and 14 on the floppy disk side)

Dan.

I have an original Crazy Dots manual in English, plus original discs, but note they were for the Crazy Dots I version, before my card was upgraded to cater for 16m colours.

Note also, that while the docs describe the operation of the Crazy Dots software, it was originally supplied with NVDI 2.51 for ET4000, so the Crazy Dots software was probably never ever used with this card.

As Jo says, there was a specific ET4000 version of NVDI4, while NVDI 5 brings it all together and is described in the English NVDI manual. The only other software used with it was VMG-4000.PRG, which was the Video Mode generator tocreate additional sceen resolutions in various colour depths specific to the capabilities of the monitor you use.

There's a version of VMG4000 on Jo Vandeweghe's site - I have v1.08 and v1.12 here with some feeble attempts at document translations that are marginally better than what's in the original package.

I originally used this card with a Mega STe before upgrading to the TT I have now.

Yes, shifting the graphics in Everest on a TT is way slow. Tempus it's not! But the benefit is strictly extra screen resolution in extra colour depth. It's definitely not intended to provide speed - quite the opposite!

Unfortunately my card won't seem to allow me to get up to 16m colours any more - I'm stuck at at 65k - but the resolution the card allowed at 16m was way below what I'd expect anyway, so I don't feel I'm losing out at all tbh. It's about as good a graphics card as you'll find nowadays.

Hello everyone,

A friend of mine recommended the newsgroups to me,he said they were.....'bloody genius and better than any sodding technical support'!!!!

I'm wondering if someone out there can help me.Does anyone know where I can beg/borrow or steal an Atari 1040STE emulator for my PC.I already have an Atari at home,but for reasons that will take to long to explain,suffice to say,its more convenient for me to find an emulator for my PC.

Please can somone out there help???

Thank you,

Kimbers.

There were/are several about, I suggest you make some web searches for Gemulator, WinSTon and PacifiST, I personally use STEEM (http://steem.atari.org/) as unlike some of the others it is easy to set up and appears to cope with both games and applications equally well.
If you deside to use STEEM I recommend that you make a directory for it and as many subdirectories any subdirectories as you require for the ST's Hard Drives before you extract the ZIP files. Then extract the STEEM and TOS files to your the main STEEM directory and run the setup program - use TOS 2.06 for the STE unless you have a file the version of TOS in your STE that you would prefer to use.

I suppose what I should first ask is what would I need one for (cubase audio ??), and what sort of enhancments would it offer.

This would help me figurer out if I need one, that said, I wouldnt even know where to get one if they were still available. (though I'm guessing it must be a standard sort of chip used not solely in falcons.)

I live in the UK if this assists in location of a supplier

Thanks... Rob

I am selling my Atari ST Collection (I collect pinball machines and full size video games and I am running out of room)

2 Atari 1040ST's (1 1040 has a PC Ditto 2 installed)
1 Atari Mega 2
1 105 meg Power drive hard drive (not homebrew, its a professional built product)
2 314 double sided drives
1 354 single sided drives
2 color monitors
1 R/C aerochopper
assorted cables, books, a few disks, etc......

$200 for all of it, or $150 and I keep one computer, a 314 drive, monitor, and aerochopper.

Please email me if you have any questions, interests, etc.......

That brings back memories. I had a Datapulse drive unit which
was an ICD controller with a Quantum Prodrive ELS 85Mb drive

I accidentally blew the drives electronics when I connected a
power lead that had the 12V and 5V cross-wired. Ooops

I did try to find a similiar drive I could borrow the pcb from
so I could salvage the data but had no luck.

I stuck an old 40Mb drive in it for a while but I don't use
it since getting the Syquest and then a Milan.

Regards,

Peter

You split into 2 files (even/odd) and burn each half into one EPROM.

>What type of Eprom would I need? Modifications to ST?

There are no pin-compatible 28-pin 128K*8 EPROMs. The 27010/27C010 will fit,
but it has 32 pins, so you need to re-wire the pins that differ in the
pinout - these are not many.

However, this works only up to TOS 1.04 - the 1040 does not have the address
decoding for TOS 2.06. You can easily built that using a GAL or some TTL
chips - several documents are available on the net.

Sounds simple enough - Literally first half and second half - or every other byte?

I think some eprom software does this - can u recommend anything that dump to file instead?

Yup, found a doc for a revision C board (mines Rev D), but any adjustments are easy done.

I've been testing my 1040STE hooked up to an external
SCSI drive with id 0 of size 512MB. The ICD driver software
boots up from drive C of the SCSI drive without any problems.
I have a Yamaha CD-RW SCSI attached to this external hard drive.

Problem: The ICD driver software does not see the Yamaha CD-RW.
It only sees the external 512MB SCSI. Here is the hookup:

1040STE --->ICD Link2---> 512MB HD ----> Yamaha CD-RW SCSI 2

When I run ICD check, it only scans the HD and doesn't mention
the Yamaha.

Any suggestions greatly appreciated.

Sean

The Yamaha drive requires SCSI arbitration, which the ICD adapters don't provide. You need a Link97 adapter which provides the required support. Unfortunately this is a hardware issue, there is no software solution :-(.

FYI, almost all CD recorders require SCSI arbitration. The only one that (I know for sure) doesn't is the TEAC CD-R55S, but that hasn't been available new for quite a while ...

Try the HD-Driver 8.1 demo on http://www.seimet.de. If it detects it the
problem is that the old icd utils aren't seeing the drive for whatever

reason, we may never know why ;-)

B******s, you need Extendos to drive the CD. ICD Pro works perfectly well,
I've used it for years.

Get Extendos from Anodyne Systems, http://www.anodynesoftware.com/

Basically I am selling all my old computer/home arcade stuff.   It just doesn't get used compared to the pinballs and full size video games.   I had ST's way back in the day, I sold them to buy pc's. Then 3 years ago, I got nostalgic and bought a local ST guy's stuff. I have had my fun and now I am ready to pass it on instead if it just getting packed away in boxes. My ST is currently sitting were I want to expand my PC network with another computer.   We have a lot of LAN parties (starcraft/warcraft/Medal of Honor) and we are hoping to have 8 computers hooked together.

Yes, it's possible some drivers allows you to connect a serial mouse
to your Atari, but in our days, a serial mouse is little difficult to
found !

You can buy the Mario Becroft interface to add a harware replacment
or simply, build yourself an interface which was designed to connect modern
PS/2 Mouse and Keyboard...With this one, you can use mouse wheel,
5 buttons, cordless or not, program somes keys...And no driver required
to use mouse. just a map file for keyboard and that's all.

With my Falcon, i use PS/2 compaq keyboard and optical wheelmouse logitech,
usb with adpater to PS/2.

I don't think a serial mouse is so difficult to find, maybe finding a 9 to
25 serial adapter is REALLY much harder to find! ...

I have literally a medium sized cardboard box full of
Atari ST floppy diskettes that I need to archive onto
a CD-R. I should be able to read the disks alright,
either with my ST or an older Mac...and the CD-R will
be in ISO-9600 format.

My question is:  Does there exist a "disk image" format
that I should use for each disk...maybe a .dsk format???
I will probably have room to put each disk on the CD-R
*more* than once...

What is this MAPFILE thing? I have a Falcon (using a PC keyboard) and I just set the language in NVRAM to suit my keyboard. It only doesn't map correctly some special keys, but I thought I couldn't do anything with it.
Can you explain this? I would be very happy to have a completely mapped keyboard now :-)

I was in a BEST BUY the other day and I noticed a NETGEAR Parallel to Ethernet Adaptor.
Would this allow me Broadband or DSL Access on my Atari Falcon?

Would I need special software?

One combo that is showing some promise...
DynaPort Scsi/Link T, using MagiC, HDDriver, and a little STing driver that is being developed. A STik driver is also in the works...

See:
http://www.anodynesoftware.com/ethernet/main.htm
(It does seem to be temporarily down...but keep trying...)

Most of the Printer Port adaptors don't work on the ST range because the ST
only implemented a minimal subset of the Centronics standard. "IBM Clones"
have more lines available, and most adaptors require these.

> Would this allow me Broadband or DSL Access on my Atari Falcon?
>

No. If you want broadband or DSL there are a number of options. I use the
board from http://hardware.atari.org/ on my STE and TT but you will need a
RealTek NE2000 clone to get it working. Lyndon can supply those.

> Would I need special software?

The above boards come with a range of drivers. I have had both STING and
MINTNET working on my ST.

Well I use CDISO from Anodyne. It copies files onto the CD's
in ISO format just fine. I make the CD's on my Hades and can
read them on my STe and of course, run all the programs. I
can even read them on my wife's PC.

I would think you would need a driver for the adapter. You want to go
to the site below. It talks about getting a Falcon hooked up to
an Ethernet network using MagicNet.

http://user.tninet.se/~gcc561r/MagiCNet/

Does somebody know where to buy a graphic card (ET4000?) for an STe MEGA4
computer? I only found atari workshop in the UK.
Thanks

Recently I got a ICD AdSCSI adaptor which enables me to connect SCSI
drives to the ST DMA (harddisk) port. Included with the adaptor was an
old SCSI harddisk (50 MB). I want to replace that one with a 1 GB SCSI
harddisk that I have lying around. Are there any special jumper
settings on the SCSI disk or other things I have to watch out for when
I want to do this?

Furthermore, I would like to know what the maximum transfer speed is
for a SCSI disk attached to the DMA port? I know that a Megafile 30
atari harddisk has transferspeeds of about 0.7 MB/sec, will a SCSI
disk/AdSCSI adaptor do a lot better?

Also I would like to know if the driver from ICD can handle VFAT or
EXT2, filesystems offered by FreeMiNT.

best regards,
Dennis

Dennis, go to the ICD website www.icd.com and you can download the newest version of their SCSI drivers (version 6.5.5). It is a free download.

If you are only hooking up one SCSI drive you shouldn't have to worry about setting the SCSI ID. As long as it isn't ID#6 (usually reserved for the ICD adapter itself).

The Driver software will have a program for testing the speed of your SCSI drives. I believe it is RATEHD.PRG. The newer drive using the ICD card should be faster than an old Megafile 30.

You probably won't be able to use the entire 1 gig of the SCSI drive. The ICD software will let you make 30+ meg partitions, but you can only have drives C through P active. The extra space will be partitioned but you can't get to them without shutting off some of the active partitions. THis is an interesting way to protect or hide some of your data.

Hope this helped

dave glish

Hi Dennis,

What the previous reply told you is essentially correct. The icd utilities will limit you to certain partition sizes, on an ST/STe I think its something like 256megs? but thats not too bad really. Big partitions will have bigger cluster sizes which will waste space on smaller files that dont fill full clusters.   Another Hard disk driver you can tell is HDdriver by Uwe Seimet. A lot of people recommend it. I use it too and its pretty good. It does support some of the newer filesystem types that mint has. And with Mint (which hasnt ever worked too well for me personally) or bigdos you can have larger partition sizes (which depends on tos version or if you using mint or magic).

ttyl,
James

With some other hard disk drivers (together with MiNT, MagiC or Big-DOS) anyboday can see and use these partitions. That's nothing one can call protection.

Hi,
I'm stranded in Christchurch New Zealand without a mouse for my 520ST Atari Computer. Does anybody have a spare one I could buy? Thanks so much.   Jack Schumaker.

Hi all.   I have just bought myself a TT, and the first thing I'm trying to upgrade is the internal hard drive. The original 38Mb drive boots up fine, but when I try a 1Gb Seagate (ST51080N) which works a treat on my Mega STE's, or any other 1Gb drive I have, it will only boot from floppy where it finds the drive for the first time but not for subsequent attempts.

I have removed the termination resistors (I think- 3 little red ones next to the SCSI connector?) and tried every combination of jumpers on the drive itself to no avail.

I am using HDDriver 8.03.

Any help or a pointer to where I might find schematics for the TT would be much appreciated.

Mark.

Hello,

There is a guy who also lives in New Zealand, Mario Becroft, who makes and sells a device that allows an Atari ST to use any PC serial mouse. I have one and it works great. But if you want an original Atari ST nouse, than you can buy one from any Atari retailer like Best Electronics, B&C Computers, ATY Computers or Sierra Bravo Computers. They are all in the US. In the UK there is the Atari WorkShop.

Hello Mark,

I have had the same problem in booting my external Seagate on my Hades. When you run the HDDrive utilites and do a device check, does the Seagate register as being there. There is an option in the utilties to Auto Configure. You may want to try that or check under Settings and then under Devices & Partitions. Your hard drive should be activated on the second line (SCSI BUS). I found that my Seagate drive was not set here, but once I did set it, it booted fine.

Also, the drive has to come up to speed before it can boot, but I am sure you know that.

Can anybody help me, I have just bought an Atari TT and a Mega STE but they are German models so I think TOS/GEM will be in German and the keyboard wont be QWERTY does anybody know how to go about converting to English
thank you

Have you tried enabling parity check (or disabling)?

That might be the thing causing the problem.

See if the drive has a feature to enable / disable it and see if that helps.

Glenn

No, this cannot be the problem. Wrong settings with respect to the
parity check result in a drive not being recognised at all.

Hi Guys   A big thanks to Edward. I opened Devices and Partitions and set the correct bus and ID and BINGO I have a self booting TT. Now to try a larger hard drive:-)

I have a TT memory board coming from Germany and loads of

30 pin simms to try on it. (Isn't e-bay wonderful) Plenty to keep me going for a while.

Thanks again for all the suggestions.   Mark.

Jon,
 If you search the archives at groups.google.com there was some discussion
about this some time ago. I think the answer was if you bought MagicC or
used one of the other replacments you could get round most of this, but the
only way to fully change would be to change the TOS ROMS.

Well if you use  Magic, I have a program that will turn the keyboard into
English.

There are a couple of pieces of software for the ST that remap the keyboard (the silk screening on the keys will still be wrong, of course!). Try ger2eng.prg and keyb_sys.lzh, both of which should be in your email by the time you read this.

Hi Jon

Bypass TOS altogether by using Magic, you get Multitasking as a bonus. =
It will also speed up that TT.

| Can anybody help me, I have just bought an Atari TT and a Mega STE but =
they
| are German models so I think TOS/GEM will be in German and the =
keyboard wont
| be QWERTY does anybody know how to go about converting to English
| thank you

For English keyboard layout check UKEX at http://www.ettnet.se/~dlanor/

Without any keybord files it will default to Swedish keyboard layout but
English is perfectly possible.

Hi Paolo,

The Cyrel Sunrise was made for the Mega STe as well but was not as comman as the TT version as I remember. It was also a quite powerful graphics card made by Cybercube in Canada. On a side note, altough neither the mega STe or TT versions have been around for a few years cybercube is still around doing other stuff.

Thanks, I already contacted Mario Becroft, and I found his card very interesting (it includes Ethernet as well), but its developement is not completed, and it is partially tested on STe. However, I'll keep in touch with him, since I think this card is THE card to coose: it's new, it's powerful and it has (will have) got Ethernet.

Paolo

Hi group,
I need to put a 720k drive back in a Mega ST4 and remove the non working 1.44 drive and bits. Are there any track cuts done when installing an HD drive, that I would have to reinstate to go back to standard please?
Bryan

Hi

If it;s the mega STE then I think it;s dip switch 8, i know by throwing
one of the switches it goes to DD mode!! But by rights it should detect
that it's a DD drive.

Dip switch 6, mate. There are 7 dips as you open the hdd cavity;-). If it is
an MegaST, there is alot more involved.

Mark

Hi everyone,

I have a problem.I have got a SCSI-Link ethernet device hooked on my Falcon.I've got a STing driver wich sees my SCSI-link.If I ping my Windows2000 machine (with internet connection sharing) it works and vice versa works too.I have in STing the gateway configured (192.168.0.1)But if I want to use CAB nothing happend.Not even a network activity.Where can I configure the Browser that he had to look at the Ethernet0 port wich is the SCSI-Link device.I hope somone could help me.

Thanks already

Marcel

Marcel,

The browser will automagically use STiNG as long as you have the STiK
cab.ovl file installed under I believe the modules folder underneath the
main cab folder.  You can get the stik ovl file at:
http://www.netset.com/~baldrick/

Enjoy :)

Yes.

I know of 2 drivers,
wrapmouse and genmouse

both can be found on the Belgian ftp server.

> Will a 2-button PC serial mouse work as a replacement for an ST
> mouse? Is any special software required?

No, I think, it is not working as a direct replacement, because the
ST mouse is not a serial mouse. The ST mouse is connected to
6 I/O ports of the keyboard controller.
But I think, it is possible to connect the mouse to the STs RS232 port using
a special software. It also may be possible to connect the mouse to the midi
port (with special connector an d software).

Michael

The one downside to this (serial mouse with driver) is that it ties up the
serial port which could be a problem if you want to use a modem on the ST.
If you have a mega STE or TT etc you'd not have to worry since you'd have
more than one serial port.

Remember that it's not even possible to fix the Falcon's SCSI problems.
The Falcon's SCSI/DMA hardware simply doesn't work as it should and even
with a clockpatch installed it doesn't always improve. There is nothing
that can be done by software to fix this

```

Just install the demo version on drive C: as explained in the README and
it will boot from it. Don't forget to read the notes about the
restrictions of the demo version compared with the full version.

And you have to load the driver every time you boot.

Or want to use the serial as a midi port.

Just buy an Atari mouse. In stock.

As is most Atari stuff.

150 EURO? Good luck... [if I put it up for that amount my inbox
runneth over]

650NLG? Well done, you got a good deal on that, but it ain't gonna
change the fact that this ST Book is not leaving my collection for
less than 600 EURO. Hell, I find stuff that is sold on ebay for 400$
for 20 EURO sometimes, and there are people who throw an Apple-I in
the trash. I did have another ST Book but that was in a very bad
condition, had no PSU, no battery and it sold it for 450$. So there
you go.

Offer > 600 Euro it is, pix are up on the website

(home.quicknet.nl/qn/prive/sa.karsseb/ebay/)

And the peasants rejoiced....

Anyone out there got the specs on the SM147 Monochrome?   I was told once
that it has audio out rather than a built in speaker. Is this correct?   I
haven't received it yet from the shipper, but, it is NOS.

Thanks
Jon

Hi Rob,
I have Notator Alpha, if you're interested. The case describes it this way,

"NOTATOR ALPHA turns the Atari ST into a complete composing workstation:
recording ideas from a MIDI keyboard onto 16 tracks with notes
simultaneously appear[ing] on the screen, altering these notes while
listening to the result, assembling segments in any order to make a score,

printing out music, both score and parts. The idea becomes both music and score."

I have the original program disks with manual and dongle in the original case. Let me know if you're interested.

Ok,

Can you suggest a method of installing a nuclear reactor in my TT to make it self powered and run for 20 years without refuelling?

Also, I'd like to install an additional 4Gb of ram and have a SCSI raid set-up. Also, another 20 cpu's would be nice. Can you suggest a way of doing this?

thanks.

I've got one, mine doesnt have any audio out or speaker. I worked in a music store some years ago that had a dealer account from atari canada and at the time the info I saw stated that the sm147 didnt have any sound capability at all. But that could have been changed in another production run perhaps.

Hi Guys!

Not to mention that using a serial PC mouse you don't get the "telepathy"
job done :-)
True, I tried it on my MEGA4 STE and the mouse is responsive almost like a
PC mouse does on PCs.
Buy ATARI!

I use a PC mouse with my Atari Hades computer that has a ST mouse port. I use
a serial mouse adapter from Mario Becroft. Works great.

I recently acquired "The Link" by ICD. IT is supposed to allow me to hook a
SCSI drive to my Atari 520 ST or so I am told.

Apparently I need some software to make this work.

Can anyone help?

TIA

Hi Brian! I have a very similar setup to yours, CT2B, Wizztronics ram
board, 32 meg alt ram, fpu, ect. When I first installed my CT2B, I had
huge problems with the SCSI, although I'm not sure they were exactly
like yours. The short story is that I sent the MB to Rudolphe in
france. He fixed my crappy install, and it has worked perfectly ever
since. It's worth it.

I have a Link hooked up to my STe and I use HDDriver as the SCSI driver. I
would reccommend that as it is the best as far as Atari computers are
concerned.

Anybody got the specs on this drive, like how to check it's logical address? The Supra utilities won't see the drive and say it's not responding.

Thanks
Jon

In case someone is interested...

I have made an 8MB Alt-RAM + TOS 2.06 upgrade for my MegaST-4, giving a total of 12 MB of system memory. The purpose of the exercise was to make a reasonably simple upgrade at low cost, using only standard TTL chips, because I do not have the resourecs to handle programmable chips. Although undoubtedly much better Alt-RAM boards have been designed and produced (i.e. the MagnumST) they are not within my reach- and, besides, it was fun to design this thing, because electronics is not my profession, just a hobby.

The design was based on an 8MB RAM upgrade for Amiga, proposed in 1992 by John Kamchen (thanks to Lyndon Amsdon for pointing to that circuit). I suppose that my design is sufficiently similar to the original one (four logic chips and two EPROMs added) so that, eventually, the PCB layout provided for the Kamchen's circuit might be adapted.

The board uses eight 30-pin 1MB SIMM/SIPP modules. AFAIK the logically equivalent 8MB 72-pin modules, or any other having 10 multiplexed-address lines can be used. The memory chips used should have CAS-before-RAS refresh capability (not all SIMM modules had this feature, but all those those with 8 or 9 1MBit chips should be safe to use).

Address space of the board starts at $600000, so there is a 2MB "memory hole" between this address and ST-RAM which serves (without any additional provisions) to prevent TOS from confusing this memory with ST-RAM at boot time. Either 2, 4, 6 or 8 MB can be installed at 2MB address intervals.

A pair of 256KB EPROMs on the board contain TOS 2.06 and Magic 6.2, which can be selected, as well as the on-motherboard TOS 1.4, by a three-position switch. A pair of 128KB EPROMs could be used as well, contianing only one OS, of course. Without any changes, or with some trivial changes in design, EPROMs should be replaceable with a pair of pin-compatible 128KB static-RAM chips. If SRAMs with "sleep mode" are used, a rechargeable-battery backup could be installed so that the SRAM chips would hold the OS practically indefinitely without reloading (a provision might easily be added to disable booting from SRAMs and revert to on-motherboiar EPROMs if battery power is lost). If SRAMs are used, the design would be compleely free of any programmed chips.

The design was developed on a 160x100mm single-sided prototype PCB with 0.1 inch dot raster. All chips are socketed for easier experimenting, and connected by soldering 0.25mm wire-wrap wire, except for ground and Vcc which use much thicker wires. Board sits in the 64-pin "megabus" expansion port of my MegaST; this port is logically equivalent, as far as this application is concerned, to connecting it directly to the CPU bus, for example in a chip-socket soldered piggyback upon the CPU. Beside this connector, only the power supply (5V) is needed, and two additional connections on the motherboard. These connections are made at or near W2 jumper on the motherboard which is used to select ROM configuration. The computer can be completely reverted to original state by removing the board and putting the W2 jumper back in place.

The board contains a total of 15 logic chips. Address range and CAS is decoded by a 74HCT138 chip, and addresses are multiplexed by three 74HCT157 chips. DTACK is produced by an open-collector 74LS09. Unused gates from this chip were used to improve the recovery time of the RAS and CAS signals at the end of acccess cycle. RAS/CAS delay sequence is produced by a series of Schmitt triggers in a 74LS14 chip. Interface beween the DRAMs and the computer data bus is by a pair of 74F245 bus transcievers. Multiplexed addresses are fed to the DRAMs through 74F244 and 74F125 bus buffers, which was an addition to the original design because the 74HCT157 address-multiplexers turned unable to drive the full load of 8 SIMMs (in retrospective, my decision to use 1MB modules was probably a bad idea; using an 8MB/72-pin module the load would probably be lower sufficiently that the two bus-buffer chips could be omitted; using a 16MB module would probably have simplified the design further by one or two chips because of the smaller number of CAS lines). Btw. someone with access to more exotic 74** chips like the 74F711-1 containing a five-fold 2:1 multiplexer with bus-driving outputs and integrated 30-ohm resistors (instead of the 74HCT157, 74F244 and 74F125), might further reduce the chip count by about three.

CAS-before-RAS DRAM refresh is used, i.e. with the internal row-counters in the DRAM chips. CAS-RAS refresh sequence is initiated whenever a memory access outside of the Alt-RAM memory area is attempted (i.e. any access to ST-RAM, I/O area or ROM initiates a refresh). Even if the computer is just sitting, displaying a desktop, hblank (hsync) routines (i.e. access to ROM or ST-RAM) execute sufficiently often to perform a refresh. A slight drawback of this concept is that the OS (or, more accurately- the hblank routines) can not be located in Alt-RAM, but having the two systems in on-board EPROMs, and with a possibility to replace these EPROMs with static RAMs into which the OS can be loaded, I do not consider this a serious obstacle. On the other hand, as the refresh is performed only when a memory access elsewhere is in progress, there are never any wait cycles. As a result, all programs run 3-5% faster from this Alt-RAM than previously from ST-RAM.

The board with a complete 8MB load and two EPROMs draws about 700mA.
My MegaST-4 draws, when the floppy drive is working, about 2100mA. With the Alt-RAM board added, and with the FPU-board (200mA) which I added earlier, this adds-up to a requirement for current of 3000mA, i.e. exactly the declared capacity of the Mega's power supply. I did not like this, so I replaced the power supply with another one which I had (4A/5V; 1.6A/12V).
I suppose that, had I used one 8MB memory module instead of eight 1MB modules, the power required would be significantly less so that possibly the original power supply could be kept.

In order to take care of the increased heating, I installed an additional fan into the Mega's box, in the corner diagonally opposed to the location of the poser supply. This fan pushes new air in, to the nearby Alt-RAM board and the CPU, while the power supply fan pushes the heated air out in the opposite corner.

The board works fine on a 8MHz MegaST, and the timings would be ok for a 10MHz or (somewhat marginal) for 12MHz acceleration, but most probably would -not- work for 16MHz access without some changes.

A small program (thanks to everyone who helped me with this) is used at boot time to declare Alt-RAM to the system. The program reads Alt-RAM configuration (size and starting address) from a small config. file.

Some problems were encountered during development. Slight low-pass filtering of the AS signal was required. I found out that 74F245 chips of different manufacturers behave noticeably differently regarding logic levels and delay times. Then, I had the bad luck that the set of 1MB SIMMs I obtained some long time ago were for 3.3V, which, of course, I did not know and which produced a lot of errors until I discovered the cause. It turned out that 1MB SIMMs, while not costing anything, are not easyto find anymore, so I provided the 3.3V and, after some experimenting, convinced the SIMMs to work.
Another problem occured with the DMA-chip (see my other post). A long time ago, in this computer the two ROM chips were replaced by six EPROMs with TOS1.4.
Later, I added a FPU board. Addition of this Alt-RAM board seems to have been too much on the data bus for the poor DMA chip which obviously does not have enough bus-driving power and started producing data errors (btw. this is the CO25913-38 chip which was reported to produce disk errors in STe computers).

I found out that by removing either the new TOS 2.06 EPROMs or any two (out of six) of the old TOS 1.4 EPROMs, the errors disappear. As I do not like the idea of replacing the DMA chip (not socketed, and, besides, I do not have another one), I have yet to decide what to do: completely remove old TOS 1.4 or remove the new EPROMs and load TOS 2.06 into ST-RAM using the old TOS 1.4. Or else- I may consider changing the design of the board so that the new EPROMs sit "behind" the Alt-RAM bus transcievers and do not additionally load the data bus. But this may require one chip more on the board.

The board is currently in my Mega (less the EPROMs for the moment) with full 8MB Alt-RAM, and the just-noticeably increased speed, together with larger memory (more then 10MB free with NVDI, some accessories and other things loaded) and ability to load items previously impossible, gives a very nice feel. OS replacements/expansions like Magic or Mint or a nice desktop like Jinnee become realistic options instead of hypothetical possibilities.

Regards;

Recently I have made an upgrade for my MegaST (see my other post), the upgrade consisting of 8MB of Alt-RAM and EPROMs for TOS 2.06. TOS 2.06 can be switched off and the machine reverted to on-motherboard TOS 1.4.

In testing the card, I noticed that errors in hard disk access happen. I found out that errors disappear if I remove the TOS 2.06 EPROMs, but occur again if those are physically in the machine, even if they are deactivated and the computer is running old TOS 1.4. Then I found out that the errors disappear again if I remove just any two or four of the six old TOS 1.4 EPROMs and boot the computer from new TOS 2.06 EPROMs.

Further tests showed that the frequency of disk errors was significantly reduced (but not completely eliminated) if I placed a very large (several uF) decoupling capacitor immediately next to DMA chip, and reduced even more if power supply voltage was increased to cca 5.10 V.

Checking the part number of the DMA chip, I found out that it was the CO25913-38, which was reported to produce exactly this type of errors in some STEs (and MegaSTEs?).

My conclusion is that the CO25913-38 version of DMA chip simply does not have enough bus-driving capacity and is thus producing erroneous data on the bus. It seems that it was running near its limits from the start, so that in the original state of my MegaST this made no problems, but since then the data bus in this computer has been loaded more and more with:
- replacing the original two ROM chips with six-chip TOS 1.4;
- adding the FPU;
- adding the TOS 2.06 EPROMs;
- adding the bus transcievers for Alt-RAM;

which, apparently, was just too much for the DMA chip. I suspect that a STe, having a different hardware design than a ST, presents an even higher bus load which he CO25913-38 chip can not handle.

So, beside the STe owners, anyone attempting adding upgrades which sit on the data bus in a ST-series computer should beware of this version of the DMA chip.

cu;

Wonderful! I thank you for your info. I never received a book with this drive and had no idea where to look.

Thanks again!
Jon

Hi guys! I would like to ask something about my latest MIDI device for my Falcon: SoundPool MO-4
First: how is the power scheme? (I bought it with internal power setup, so I have a 5 PIN socket, but there's no info about the voltage)
Second: Do I have to do something after the powerup and copying the MROS in his directory?
Third: Is it normal that I see the 4 MO-4 channels blanked in the selection

box?
Thanks.
Paolo

Can we have a look? That is probably the most sexy thing I have heard all year on the Atari scene. How about a schematic? I would love to see a photo too.

Regards and reverance

Mark Bedingfield

All PS/2 modules I know can handle CAS-before-RAS refresh (the Magnum uses
that, too).

>EPROMs should be replaceable with a pair of pin-compatible 128KB static-RAM
>chips. If SRAMs with "sleep mode" are used, a rechargeable-battery backup

Or Flash ROMs.

>The board contains a total of 15 logic chips. Address range and CAS is
>decoded by a 74HCT138 chip, and addresses are multiplexed by three 74HCT157

Wow. The Magnum used three chips, two HCT157 and one MACH210 ;-)

>at the end of acccess cycle. RAS/CAS delay sequence is produced by a series
>of Schmitt triggers in a 74LS14 chip. Interface beween the DRAMs and the

That part may need tweaking when building additional units, the timing will
vary depending on manufacturer of the LS14, temperature, operating voltage
and phase of moon ;-)

So some adjustment may be needed to get to a stable point so that variations
do not disturb the operation.

>turned unable to drive the full load of 8 SIMMs (in retrospective, my
>decision to use 1MB modules was probably a bad idea; using an 8MB/72-pin
>module the load would probably be lower sufficiently that the two bus-buffer
>chips could be omitted; using a 16MB module would probably have simplified

Definitely, and 8MB PS/2 SIMMs are easy to get. The Magnum runs completely
unbuffered, and the '157/MACH210 directly drive the multiplexed address
lines.

>CAS-before-RAS DRAM refresh is used, i.e. with the internal row-counters in
>the DRAM chips. CAS-RAS refresh sequence is initiated whenever a memory access
>outside of the Alt-RAM memory area is attempted (i.e. any access to ST-RAM,

This will generate *lots* of Refreshes - and these tend to sonsume quite a
lot of power!

Maybe adding a dedicated refresh counter that gates refreshed for some time amount would help, although I am not sure how much.

Are you sure the problem is not due to the extra drain on the power
supply with the extra chips installed dropping the instantaneous
voltage to some parts of the circuit? The improvement with the large C
points to something like that. Even your replacement power supply
might be strained a bit. Also, are the connecting wires from it thick
enough not to produce an unacceptable voltage drop at the higher
current? Try feeding the whole shebang from an external PC supply of a
higher capacity and using thicker connectiong wires, and see what
happens then. Just a guess, but worth trying....

If this doesn't work, it might be worth while getting a replacement
for the DMA chip from Best Electronics.

Regards, /Peter/

Yeah, and I have a bad feeling I lost my Scooter PCB file I did for
Djordje. Argh, I spent the whole weekend doing it from morning till
late night. I'll have to search on floppys but the zip disk got
corrupted which it was certainly on.

>In case someone is interested...

Very interesting Djordje!

Anyone with an ST should be pricking up their ears at this.

Cheers

Derryck

I built a monitor switch to allow me to use an older model Multisync monitor with an Atari ST. The monitor is a Mitsubishi Diamond Scan model AUM-1391A. The monitor syncs fine in the two Atari color modes but there is a vertical roll when I switch it to the Mono mode. I have checked all of the connections on the switch and they seem to be fine. The picture that I can make out as it rolls seems to look fine (other than that rolling).

I'm going to try and hook the Atari up to some of my other monitors, since the Mono mode is the only one most monitors will actually do. If it still rolls then I am guessing that I am getting interference from the wiring in the switch box or somewhere else. The monitor works fine when hooked up to a standard IBM clone machine.

Hi Graham.   I have the Gasteiner s/ware somewhere. I started on one of their Mega STE's back in...... well a while ago:-)   Frankly I wouldn't recommend it. A much better alternative is Uwe Seimet's excellent HDdriver. It costs (not much) money, but is still supported!!!!

If you still want the Gasteiner driver, let me know off list and I'll send it attached.

Mark.

I suppose I could only really make sure by replacing the chip and seeing what happens then, but the average supply voltage is set at exactly 5V, measured on the board, not on the PSU, and there are a lot of decoupling capacitors and a couple of additional tantals and electrolytes all around, so it looks to me that the supply is more-less ok . btw. regarding the wires I am becoming suspicious about the ground traces on the motherboard in the vicinity of the DMA chip, they appear to be rather slim; maybe I should connect a thick ground wire from the DMA to near the PSU to see what happens...

>If this doesn't work, it might be worth while getting a replacement
>for the DMA chip from Best Electronics.

And, of course, I could reverse to original conditions- i.e. reduce the load to what it was before :)

Yes, but AFAIK writing to Flash chips is a little bit more complicated than
writing to ordinary SRAMs, isnt, it?

Well, I admitted at the start that Magnum was a much more serious and
better design and paid my reverance :)   And, regarding the number of
chips, I dislike myself very much the final chip count of my board,
especially having to add those two address-bus buffers onto a practically
finished thing.

I am aware of that, but was I am not trying to set a production line, just
to satisfy my own needs the best I can at low cost, and so anyone else who is
interested can at least have some general parameters. This has been working
OK for almost a week now; I will see what will happen next summer when the
ambient temperature here rises by about 10 degrees Centigrade. As for moon
phases, intensive monitoring of the board's performance throughout a

complete cycle of the Moon is in order ;)

>So some adjustment may be needed to get to a stable point so that variations
>do not disturb the operation.

In fact, from the start I had some small trimming resistors in the delay lines for CAS-RAS (refresh), address-multiplexing and RAS-CAS (read/write), but RAS-CAS delay is rather generously timed at somewhat more than 50ns (remember, I did not intend this to work at 16MHz), the addresses being multiplexed somewhere about the middle of this interval, so I suppose there is plenty of latitude for variations. The board started to (almost) work on the first or second try, and a look with an oscilloscope was enough to set the timings to decent values.

But I don't expect much trouble on that detail; what worries me much more is whether the hacking done to make 3.3V SIMMs work will prove reliable. When I found what was the case I was just stubborn to make it work; maybe I should have abandoned the prototype and re-designed everything around an 8MB PS/2 module, but could not afford to spend much more time on this. I provided about 3.4V for the SIMMs and the board started to behave more-less OK, but, mostly by trial and error and without any real knowledge I found that for completely error-free operation I had to slightly lower the excitation voltage of a pair of 74F245s between the DRAMs and the data bus. Some specs for 74F*** that I have said that recommended excitation for 74F was 4.5 to 5.5V; these two chips settled for about 4.8V.

Yes, I thought it would be something like that, but as I said, by the time I found it I was more-less commited to the almost-finished device. and couldn't even accomodate the 72-pin module on the available space on the board. Btw. I noticed that you did not mention any data buffering either, is then the 8MB DRAM module directly on the data bus? If that is so, I could have reduced chip count by two more. On the other hand, maybe omitting the data bus drivers would not be wise in my case, as this board is not upon the CPU but in the Mega's expansion port, i.e. with some length of the lines between.

>

>This will generate *lots* of Refreshes - and these tend to sonsume quite a
>lot of power!

Yes, and there is even more of them :) ...I have only one RAS line and eight decoded/datastrobed CAS lines, so during a byte access all not-needed bytes gets RAS-only refreshed on whatever row happens to be addressed.

Ooops, I have just realized that in order to use an 8MB PS/2 module maybe I would have to make slight changes in the design; I have one RAS and eight decoded CAS lines, IIRC an 8MB module have a slightly different organization; will have to check the pinout.

>Maybe adding a dedicated refresh counter that gates refreshed for some time
>amount would help, although I am not sure how much.

During experimenting, the board was for a while running fine with refresh being initiated just by accesses to ROM area (i.e. knowing that at least hblank -must- happen every now and then, and it happens to be at about the right frequency). But I provided refresh upon access to ST-RAM for the hypothetical possibility that an alternative OS might be loaded into ST-RAM, and provided refresh upon access to I/O area for the purpose of being able to test the memory while working with old TOS which is in that area of addresses. But I suppose that at least the refresh upon I/O access can be dispensed with, because Alt-RAM can't be used with TOS1.4 anyway; this change would require me to reconnect just one line on the board.

Btw. I like that little gain in speed (3-5%) which I attribute to refresh being synchronized to off-board accesses. Maybe a provision could be added that would permit refresh only during off-board access which happen when a hsync pulse is active, but I am not sure if it would be worth he trouble.

Lyndon,
I am afraid I did not use that layout after all :(the schematics has
changed significantly from what I suggested to you at that time, and in the
end it was made on a prototype board. And, realizing now the consequences of

using 1MB modules (lots of power needed, address bus drivers needed...) and the possible benefits of using one 72-pin module, probably someone wanting to make a PCB could hardly use it anymore, anyway.

btw. for others reading this- it was an approximately 150x100mm double-sided layout.

Only for the software - the bus interface looks the same, and the software is not *that* complicated. You need multiple-byte sequences to erase a sector or write a byte, but there is not much effort to it.

>Well, I admitted at the start that Magnum was a much more serious and

>especially having to add those two address-bus buffers onto a practically

>finished thing.

It is just fine for a design without programmable logic - the comparison
only shows how much can be packed into one of these PLCC-44 marvels.

>I am aware of that, but was I am not trying to set a production line, just
>to satisfy my own needs the best I can at low cost, and so anyone else who is

>is then the 8MB DRAM module directly on the data bus? If that is so, I could

Yes.

>Ooops, I have just realized that in order to use an 8MB PS/2 module maybe
>I would have to make slight changes in the design; I have one RAS and
>eight decoded CAS lines, IIRC an 8MB module have a slightly different
>organization; will have to check the pinout.

There are two types: "single-sided" (ie. one bank) and "double-sided" (two
4MB banks), with the latter being the most used.

>During experimenting, the board was for a while running fine with refresh
>being initiated just by accesses to ROM area (i.e. knowing that at least
>hblank -must- happen every now and then, and it happens to be at about the
>right frequency). But I provided refresh upon access to ST-RAM for the

Um - the hblank interrupt ist turned off normally, so you get only VBLANK.
That might not be enough.

>Btw. I like that little gain in speed (3-5%) which I attribute to refresh
>being synchronized to off-board accesses. Maybe a provision could be added
>that would permit refresh only during off-board access which happen when
>a hsync pulse is active, but I am not sure if it would be worth he trouble.

More something like a real counter that counts down to the time when the
next refresh should happen, and *then* activates the refresh on the next bus
cycle that does not access the alternate RAM.

Or, if the problem is insufficient output from the CO25913-38 chips, there is a quick but sloppy fix, if you have several of those chips. You can parallel the things, by putting one DIP package on top of the other and soldering matching pins together. This can be even a temporary thing to find out for sure what the problem is.

Other similar problems come from running a fast output from a slow input chip, under the chip. It may couple to the internal jumper wires from pin to silicon chip, and cause spurious signals on the output.

You can investigate if that is happening if it gets better with a chip removed, or with a socket under the chip. This does not seem to happen to a noticeable amount with socketed chips.

Been there, done that. New people make old mistakes quite often.

Jim

As a follow-up. I did try the Atari and switchbox on another monitor
and it works fine in Mono mode (no rolling). That must mean that my
Mitsubishi has a problem. I know there isn't an external adjustment
for roll. Anyone have any suggestions?

I suppose then that it would be something like a need to load that memory block in sequence, possibly in some "pages" or blocks or simething like that-possibly similar to what any ram-tos loader would do anyway?

Do those two configurations have different control lines then?
Some information which I have on 72-pin SIMMs appear to be contradictory and
incomplete. Would you, perhaps, be so kind to post the pinout(s) of
connectons to the the 8MB 72-pin modules. Perhaps it would be of interest
to other people as well, doing other kinds of memory upgrades.

>>During experimenting, the board was for a while running fine with refresh

Now this worries me! If it is so, then why is my ram board working at all?
I asummed that each row must be refreshed every 4ms or so, and that
a tos routine is executed during each hsync which should give about right
average timing. Relying on vblank would not be enough for sure. Are there
any other ram/rom/io accesses which happen on a regular bases without any
excuse and often enough?

Thanx in advance;

I am selling some computers :

1 Falcon 030 with CT2B , hard disk : IDE 4Go, VGA adaptator, mouse
It is in his original case
16Mo of TTRAM, 14 Mo of STRAM

1 central unit of MegaSTF1 (without keyboard , without mouse souris, only

the central unit)

1 Amiga 4000T Escom's model, with a hard disk of 520 Mo SCSI, 2Mo of chip
RAM , 16Mo of Fast RAM

Yup. It is explained quite well in the datasheets. An Atmel 29C010/29C020,
or an AMD 29F010/29F020 (available in DIL) should work fine.

>>Try a hair dryer ;-)
>
>But it would not be the same situation as when the complete computer gets

In my experience, this makes no big difference. The timing shifts when the chips get hotter, and it does not matter much why and how fast.

>>There are two types: "single-sided" (ie. one bank) and "double-sided" (two
>>4MB banks), with the latter being the most used.
>
>Do those two configurations have different control lines then?

Yes - it is basically either one or two memory banks, with (partially) separate control lines.

>Some information which I have on 72-pin SIMMs appear to be contradictory and
>incomplete. Would you, perhaps, be so kind to post the pinout(s) of
>connectons to the the 8MB 72-pin modules. Perhaps it would be of interest
>to other people as well, doing other kinds of memory upgrades.

Difficult - the information I could quote from memory would not be very exact. Better look up the datasheets: Micron had gooe ones, even for the complete modules.

http://www.micron.com/products/datasheet.jsp?path=/Modules

This data sheet:
http://download.micron.com/pdf/datasheets/obsolete/modules/DM57_2.pdf
explains it quite nice - it even gives the differences between the 4MB and 8MB versions, and tells how to use the module in 16-bit mode.

A single-sided 8MB modules looks just like a single-bank 16MB modules, only with reduced capacity, ie. one de-multiplexed address line is 'nc'.

>Now this worries me! If it is so, then why is my ram board working at all?

>excuse and often enough?

Not guaranteed. If you have Magic or some other OS running in RAM that completely replaces the TOS, you will have zero ROM accesses. On the other hand, with TOS in some loop in the ROM, you will not have any ST-RAM accesses.

The video access will always be there (it does the refresh for the ST-RAM), but you don't see these on the CPU bus.

cu

There is a piece of hardware that I am using that allows a ST (or any Atari
computer that has a ST mouse interface like my Hades) to use a PC serial
mouse. It is an adapter by Mario Becroft.

This link is quite sufficient; thank you very much. And, btw. indeed
the organization of control lines on those modules -is- different than
on my prototype, so I could not use a 72-pin simm without slight changes
in the schematics.

>Not guaranteed. If you have Magic or some other OS running in RAM that completely replaces the TOS, you will have zero ROM accesses. On the other hand, with TOS in some loop in the ROM, you will not have any ST-RAM accesses.

Yes, I see that an OS in RAM will have no ROM accesses and v.v. But -any- of those accesses would do, so long as it happened at short intervals, and I was wondering what was that which was happening on the address bus often enough to make the refresh on my board work, because this alt-ram appears to be working quite reliably now, with plain tos as well as with a bunch of alt-ram-resident programs. I suppose that some interrupt routine or other or some loop in ROM must be executing, or else these 1Mbit DRAMs have data-keeping ability much better than assumed 4ms. Vblank only, happening at 15-20ms intervals, does not seem to me to be sufficient for refresh. Unfortunately, I do not have a 'scope at home to try to see what was is the matter, I took the ram-board to work and used a 'scope there for checkout and adjustments.

It *may* be enough. Modern RAMs *can* be very light on refresh requirements,
but of course this is not guaranteed to work. I have seen DRAMs hold their
contents after up to 30 seconds without refresh (and without power). Several
seconds is quite common, so if you violate the refresh timing, it may still
work.

What did you use to write the files? Do you still have the program? If the
program used was First Word, it was ported over to the PC. I believe it was
the only program ever to have been ported. You could just load in the files on
the PC and you are in. Otherwise you could try a ST emulator, convert the
files to ASCII and then import them into the PC or Mac. Or you could just buy
another 1040ST (prices are not high) and convert them that way. Or you could
sen them to a person who has an Atari and have them do the conversion.

Only after buffer board!
The buffer should save the rom port and it should connected while the
computer is OFF.

Insert buffer into rhe rom port with power off.

> I was mainly hoping that the buffer "reconditions" the data signals,
> since the extension cable probably "weakens" it because of the longer
> distance from the computer (in addition to being more open for noise
> etc.)

Best way is to connect anything while the computer is off.
(Save way)

After this buffer you can connect a expansion with power on, but normaly the computer do not accept the expansion. You have to restart the computer.

> Unfortunately there's no lettering or any other identification on the
> circuit board(s) (there's one circuit board at each end of the cable,
> though only one board contains electronic components -the other board
> simply contains a connector for inserting a dongle etc.).

Normaly the board is marked with "oben" and "unten".
Means: upper and lower side.

The side with a smal square smt left and two bigger smt on right side must be insert upside. The side with three bigger square smts is down.
(Hope it is the c�t buffer)

Flat wire lengh is 2 meters maximum
After flat wire you can connect dongles, expander boards and some else rom expansion boards.

> The seller *thinks* it may be produced by the German company "Hard &
> Soft", but isn't sure.

It�s a old project from german c�t computer magazine.

> Can someone tell me more about this device?

DOITF030 article 12.9.1
Article also contain pictures for what is upper and lower side :)

DO NOT INSERT THIS BUFFER WITH WRONG SIDE UP.
Costs rom port and buffer board!

Regards, Robert

I'm testing the MIDI ports of a TT and it sends data correctly on the MIDI OUT but receives only bytes equal to 0 on MIDI IN. Can you suggest what can be wrong and what tests to do to correctly diagnostic the problem ? It seems to me strange that I correctly get the bytes from the port, without errors, but the bytes are all zeroes....

Hi, Hallvard!

A small add-on to Robert's posting:

HT> - 74LS244 (5 chips)

These are three-state line driver ICs.

HT> - 74LS08 (1 chip)

This IC provides AND gates.

The driver ICs are three-state, so they can be switched to "shut the doors". Maybe this is supported by the circuit, then there must be some way to "switch" it (by hardware switch or by some little piece of software).

Here doitf030 surely will tell more, if the circuit is not an independent development.

Regards,

Alexander

Nope. It won't even see the drive at boot up. I tried for some time various things with no success. It's quite disappointing. I had 2 drives from 2 different sources, both do the same. Nothing.

> -how does it compare to a regular harddisk.

Had it worked, the access time would of been much better, like 2ms.

> -software (HDDriver?)

Old version.

> -installation procedure/problems

It looks and hooks up just like any 3.5" IDE drive.

> -total cost

In a word... ebay. ;o)
You can look up the cost of new ones, SimpleTech still makes them.
I happen to get hold of SanDisk brand (3.5" models discontinued). I don't know if that would make a difference. It might since my Hades does not like maxtor drives on the ide buss, but quantums works fine. Unless I get hold of a SimpleTech model I won't know.

Oh, whilst I had the machine apart and had given up on the IDE flashdrive, I decided to test another idea. Booting from my scsi PCMCIA card reader/writer, as in no rotating disks attached to the machine. That works!!!!! It feels freaky, soon as you power it up, no spin up or noise, just bam the desktop apears. It feels like the thing boots entirely from rom. Bizarre. Only problem here is the microtech units I got are not that quick, the transfer rate is not so great.

Someone else attempted to boot from such a gizmo, but if I recall it didn't work.

That ends my flash adventures for this installment. ;-)

Yes, i do it als allway the computer is off. Best way.

> What do you mean by "smt" and "smts"?

SMD electronic parts, isn�t the right english word "smt" for?
Hm, have to use dictionary :)

> The seller had attached some stickers to both boards, so I have no
> problem with what side is up/down.

OK, great.

> But I was hoping for some more information on the board: what the
> electronic circuitry actually does: hoping it "reconditions" the signal,
> where it would be weaker and prone to errors without the buffer
> circuitry. Can you confirm if this is what the circuit is basically for?

Yes, it�s an bus driver. Remeber: Ataris do not had bus drivers for most
ports. So it is a good part to save the rom port with an smal driver
(buffer) interface.

> 2 metres???? Wow. I didn't know you could extend it that far. The
> supplied cable is around 40cm.

Yes, that is the absoulute maximum of.
Ataris with an accelerator may use shorter cables.

> So the buffer board was actually designed for the Falcon? But will work
> with standard STs as well I presume?

It can be used with any rom port on any atari.

Regards, Robert

Should work. I had mixed results: one IDE flash disk worked fine, the other would not work with HDDriver (and the TOS had some detection trouble, too).

>-installation procedure/problems

Just like a normal IDE disk. Some come in 2.5" form factor and require a 5EUR adapter.

I have a Falcon030 with a 100 meg iomega SCSI zip drive. I used HDriver 7.+ to format and partition. The problem I am having is when I run Magic 5.11 the Falcon030 sees the zip drive, when I just run TOS 4.04 the falcon can no longer see the zip drive. Does anyone know what I am doing wrong or missing a step in the process?

Thanks in advance for all help.

When I connect the Falcon030 to an Atarir SC1224 monitor under TOS the SC1224 monitor works fine. If I run Magic 5.11 using MAGXBOOT.PRG from the auto folder, as soon as the MAGXBOOT runs the monitor starts to scroll rapidly. Is their a solution to this problem?

Thanks for all help.

>CAN I SAFELY TRASH THIS?

The program DCCLK.PRG obviously has some purpose. Until you know what it does it's very stupid to _trash_ it. Keep the original floppy write potected and work on a copy.

It could be some sort of driver for an internal reltime clock or something?

As a rule PRO24 likes a clean computer. This means a minimum of .PRG files in the AUTO folder and no .ACC files in the root directory of the floppy you boot from.

First try a blank formatted floppy in the diskdrive when you power up the computer. AUTO folder .PRG files and .ACC files will only load at boot up. So this means none of these will run.

[Assuming no harddisk there might be a good thing to first power down the computer for 30 seconds and then start it with _no_ disk in the drive. When you do this you will get the desktop after less than two minutes and the computer will be virus free. After that insert a blank floppy and format it and then open the write protect tab. Until you have a chance to virus check your floppies _always_ have this blank floppy in the drive when you power up or reset the computer. Old second hand floppy disks often have bootsector viruses on them and this is even more true among ignorant musicians :-)]

Then insert the PRO24 floppy and open the A floppy window. Double click on the PRO24.PRG (or similar) icon and it should launch. If not, something is wrong with the program.

Also note that PRO24 only runs in monochrome mode. If you use a TV or colour monitor you are out of luck. You need a SM124 mono monitor o a VGA with a proper adaptor to be able o get the computer into monochome mode.

Hi Claude!

There are 2 possibilities: Perhaps your NVRAM is set to VGA. Under TOS, run NVCONFIG.CPX and make sure the top right popup shows 'TV'.

Alternatively, could it be that your default MagiC desktop is set up for ST High? The SC1224 will not lock to the vertical frequency this uses. If you have a VGA or SVGA monitor, try connecting that, resetting the desktop to ST medium and saving newdesk.inf again.

I may be quite wrong, but it's worth a try!

Regards, /Peter/

> seems that each manufacturer wants to number the list their own way!

Because the Motorola 680x0 processor doesn't define numbers for those errors. They're *exception vectors*, which are stored in the first 256 bytes of memory, 4 bytes each:

ADDRESS   PURPOSE

0000 0000	* reset: initial stack
0000 0004	* reset: initial vector
0000 0008	Bus error
0000 000C	Address error
0000 0010	Illegal instruction
0000 0014	Divide by zero
0000 0018	CHK instruction
0000 001C	TRAPV instruction
0000 0020	Privilege violation
0000 0024	Trace interrupt
0000 0028	Line 1010 emulator
0000 002C	Line 1111 emulator

(* the first 8 bytes aren't really exception vectors -- they contain the values used to initialize the stack pointer and program counter when the CPU is reset.)

Apple and Commodore could have reported these exceptions by the memory location of the vectors, but they didn't. Instead, they both decided (independently of each other) to number the exceptions sequentially. They also followed the popular programming practice of reserving the value 0 to mean "this operation completed without any errors".

Apple decided to number the exceptions starting with 1 = the first exception (bus error).

Commodore decided to number them by dividing the vector's memory location by 4. The first exception vector is at memory address 8, so it got assigned the error code 2.

Neither Apple's nor Commodore's numbering is "right" or "wrong"; they're just different.

Whops..
So you had an buffer i never seen before.

> I'm not sure what you mean by "bus driver". Please explain.

Easy, an bus driver as example: 74x244 or 74x245 TTL (and some other)

> The plan is to install several cartridge devices (MIDI related mostly)

Yes. That is what i do some years ago. I used one rom port inside case
for an eprom card and the other port external als rom port for other
modules.

That works great for a long time on my 520ST.

Regards, Robert

Hi Lonny,

That would be me. I have the 2 PCMCIA slot model, and the 1 PCMCIA/1 smartmedia model drives. Both are Microtech and neither would boot up without a warm reset. :-(Are you using the 3 card drive model? What host adapter are you using?

Hi,

I have several of the dual microtech units. They all are straight pcmcia slots. It's on my hades060 scsi bus with an old version of HD driver. In fact it booted from the second slot as I had slot #1 empty, I was quite amazed.

I got ahold of one of those 3 card models (pcd-47?), and had nothing but problems with it, it hung my system with or without media. I ended up returning it only to have the seller tell me that it was fine.

LP,

You should keep in mind that CF cards and Flash RAM in general is very limited life. You should avoid writes to it at all costs and use it more as backup. If you use it as general store and retrieval like mp3, that's one thing but I wouldn't go using a CF card as swap memory ;-)

That's the main idea, backup. Got burnt with a zip drive
so I don't trust those anymore. ;-)
I just did the boot test for the heck of it while I had the
rotating disks removed.

Hi,

Some time ago I posted about the troubles I sometimes have when I'm using my CT2b in turbo mode. One guy then advised that I should get a stronger power supply. I didn't find any then and went on using and observing the symptoms.
Since I found out some new things now again I ask for advice.
In practice there are two different problems both leading to a crash when I boot my falcon in turbo mode. In slow mode it always works 100% reliable.

The first problem occurs nearly every time I switch on the falcon and immediately try to work. Then the system crashes or hangs after maybe a minute or so. When I wait a bit after switching on before booting up the crashes get more seldom and when I wait e.g. for ten minutes then the problem doesn't occur at all. Nevertheless it's kind of stupid that when I'm in a hurry e.g. to look up something I always have to use a slow computer. So it would be nice if there were some cure for that.

The other problem seems to be about something about a net filter since most of the time the reason of it's occurence seems to be when the washing machine, which unfortunately is connected to the same phase, is working. Would voltage filters, like they are built into some of the more expensive table power outlets, help with that ?

Another thing I'm wondering about are 'ghost messages' at bootup, by which I mean that some or all of the bootup messages are displayed a second time in another color overlaying the text of some other line. This effect appears in a highly random way (from a single word up to the whole screen) and only at bootup. At the moment GEM takes over everything looks normal again.

Any ideas ?

Thanks
Gerhard

Hi Janka, not to sure of the boot problem's, I used to have an Eagle Sonic card that seemed to be a problen for about ten minutes and was then fine after that, could never use it straight away. After I changed the Hard drive from a 800 to a 1.4 the problem went away???? I can't explain it either. I copied all the files from 1 drive to the other, so both setups were identical bar the harddisk driver file (hddriver7.6).
The display problem is because NVDI hasnt initalised before the rest of the auto folder applications. You can also set the falcon's default boot res to ST high, in the NVram. It boots a lot quicker and less likely to give the ghosting effect.

Hope it helps

Mark

Although I don't understand why that could be, it is very interesting
because I think that my problems started after I replaced the original
2.5" 85 MB IDE hard drive by a 3.5" 20 GB IBM IDE drive. Any suggestions
for a good and quiet one I could use instead ?
BTW, it shouldn't have been the additional power needed by the new drive
because at the same time I swapped the IDE drives I also removed one
of the two internal SCSI drives.

Aha. So at least it's nothing to worry about.

Thanks
Gerhard

     Hi, "D"!

DG> Will i have any  problems to have in a Falcon an IDE CD-ROM and a SCSI
DG> CD-RW, or opposite a SCSI CD-ROM and IDE CD-RW?

If the drives are supported there will be no problems. I think that
there was only one driver (by Andoyne or similar) that supports
rewritable CDRoms.

In general it does not matter wether the CD-ROM is attached to SCSI or
IDE. I am not sure wether IDE CD-Writers are supported (in their writing
part...). You should have a look at your Writing-Software manuals for
this.

DG> Does this combination work good?

I suppose there are no problems with any combinations if each part works
properly.

     Regards,

          Alexander

Your best bet is to check with the programs authour (Ie. Anodyne software) about the specific drive (specific model number would be best) to be sure it works with the software before you buy the drive & software so you can be sure if they'll work together, otherwise you'll get a major headaches trying to sort it out if it doesnt work.

ATAPI CD writers, which are connected to the IDE port, are supported by
Anodyne's software.

```

I've a CT2b w/32meg fast ram and FPU along side a 16meg Wiztronics memory board. It truly is a god send...amazing how zippy the Falcon is now...
The catch is, for this stellar performance, I have to go all IDE ...I really have to avoid anything SCSI, especially under MagiC 6.01. Sadly, SCSI is the heart of my set-up...got scanners, ethernet, and lots of nice big drives for CueBase Audio and other storage whims.

Under MagiC 6.01
NVDI 5.03
HDDRIVER 7.93

SCSI access freezes the system quite often in Turbo Mode, thoe the mouse still moves. Forcing a SCSI bus reset (ejecting a CDROM or dropping power a second to my SCSILINK ethernet box) brings the bird back to life.

Also...
CueBase Audio barfs complaining of a million and seven SCSI errors. Yes, I have read, reread and tried dilligently every suggestion offered in the CT2B docs..with and without the MROS patches...with every set of hard disk drivers I know of (Cecil, HDDriver 3 - 8, CBHD, ICD, HDX, etc) and they all act about the same in reguards to SCSI.

Yes I've checked and rechecked the SCSI chain...with fresh cabling and well terminated (even down to a single drive on a meter tested 2' SCSI II to SCSI II cable). I've tried every combination of parity and term power settings every drive I have offers...on SCSI I, SCSI II, and SCSI III drives...Segate, Western Digital, and IBM, sizes from 80meg up to 5gig. Tried other SCSI devices alone on the chain as well (SCSI Link, Scanners, etc...)...with and without arbitration, etc...

In Turbo mode, under MagiC these freezes are consistant and annoying! They are at their worst with any software that uses SCSIDRIVER to constantly poll the device (such as the SCSILINK ethernet device with Roger's STing driver).

Interesting note...
Under Mint and N.AES 2, HDDriver....
I can grind at the SCSI drives all day long with hudge copy and moving tasks (I.E. a 50meg mpeg movie) and do not get these freezes. Sadly, STing doesn't work for me under MiNT/N.AES no matter what I try (ethernet access to the DSL switcher being the aim here...no MintNet drivers yet).

In regular 16mhz true Falcon mode...
I can run CueBase Audio quite well...
I can use the ethernet device with decent transfer rates (the applications are just dog slow in this mode).

I've checked and double checked solder points for the CT2B install...
I've tried every combination of wait states offered in just about every CT2B firmware/flashROM release I've managed to get my hands on (from the DHS site).
I've also tried going with VERY LOW screen resolutions such as ST modes in case higher resolutions were just hogging too much bandwidth across the bus. I'm at a loss...

Some extra info:
I've heard many times, "Oh, just switch to Cecil, and your problems should go away." I've tried it.

1. No matter what I try, Cecil will not boot MagiC 6.01
2. It doesn't seem to have any SCSI driver or XHDI support...it doesn't even see the SCSILINK.
3. It does boot plain single tos quite nicely...but still...CueBase Audio is useless, and other SCSI operations, if they don't freeze the screen, they make the hard disks sound as if they are trying to do back flips out of their chasis and do a light show that could be sold to a disco tech.

Any tips on what might get this SCSI timing worked out?

It's also worth noting about a typical set up:
MagiC/NVDI/STing
Intention is a good DSL internet workstation...
The cooler the machine...the longer SCSI will work without SCSI bus resets and/or system freezes. Even when there is no data on the ethernet....I can watch the little drive light on the Falcon flicker...as I assume the SCSILINK driver is polling the device to check for packets...after some time (wich varies from a few seconds, to SEVERAL minutes) the little light stops flickering and the screen freezes...sometimes the SCSI bus resets by itself and the machine starts working again...but MOST of the time it will freeze. Sometimes...I can see a dozen scsi bus resets in a row...it might start working again...or it might just freeze...in any case...dropping power to the SCSI link for a second or two unfreezes the computer. I have tried all sorts of settings in HDDRIVER...the various SCSI error/bus resets, CAF Fix, and the list goes on...have tired multitues of timings in the STing CPX. Furthermore...this SCSI behavior is similar with only a single well terminated hard drive, no sting, and any relevant SCSI hard disk usage.

I've seen numerious reports of rock solid SCSI with the CT2b. How do I get mine that way?

Thanks,
Brian

I have read that to copy a cd the stream have to be constant or something like this, i also have read that is not good for copying CDs to have the CD-ROM and the CD-W/RW in the same IDE chain. So what i want to know is about to have one SCSI CD-ROM and an IDE CD-W/RW or opposite knowing that both work good with the software i have, if there is any problems like the ones i mentioned above.

Thanks for your answers.

Hello Forrest...
Do you recall what program(s) you used to do your writing with?
You might want to check out Papyrus, as it can import many of the more popular Atari file formats. It's also a nice little suite of DTP utilities. Comes in Windows, OS/2, UNIX, and Atari GEM/TOS Flavors and is still supported, revised, and updated for several languages.

http://www.rom-logicware.com/e_start.htm

PageStream by Soft-Logik is also a DTP package that was born on Atari, and still should import most of the popular ST formats. I know very little about the PC and Mac versions of PageStream, but an email to their support address should find the answers you need (does this import my old st word processor files?).

http://www.haage-partner.de/pagestream/products-e.htm

Here's another option...
Emulation...should you happen still have your old program disks.

I recommend starting with Gemulator simply because out of the free emulators, it seems to do the best job at reading old ST floppies and hard disks. Again, it's free. You'll just have to find a ROM image (easily found on the net).

*** There's also a very nice utility at the GEmulator website called GEMEXPLORE that will be very helpful for getting files from your floppies or hard drives that Windows can't see. ***

http://www.emulators.com/gemul8r.htm

There are a number of other ST emulators as well...both commercial and free. Each offers something that it tends to do better than another...I.E. STeem supports MIDI, MagiC PC offers a slew of GDOS screen modes..somewhat like having a nice graphics card on an ST/TT/Falcon (above 16 colors, such as an 800X600X16million-color GEM display mode.), etc. Do searches on these keywords to learn more.

STeem Atari
Saint Atari ST
WinSTon Atari
PacifiST Atari
MagiC PC
Atari Emulation
Atari Emulator

Hope this helps....
Brian

IBM internal 2.5" 10 GB + external SCSI RICOH 6200 + PHILIPS CDD 2600
and all works fine together with Extendos Gold and CD-Writer suite.

Hi, "D"!

So you want to copy CDs on the fly and don't want buffer underruns?

Best way to archieve this is to keep both CD-Devices in the SCSI-Chain, as IDE-Devices put more stress to the processor. I guess it is better to have the source device as IDE if you can't have two SCSI devices.

-> DATA CDs:
   no problem, if recording speed stays below reading speed of CDR
   -> check max reasonable recording speed for your HW-Setup with "test"

```
      writes (with CD-writer laser switched off)

-> Audio CDs:
   here you need a good CDDA-extractor (or a good correction mechanism in
   your source device). Extract without breaks (->keep whole track in
   RAM, then put it to HD), otherwise "tck" and similar noise sounds
   might get into your track at those moments.

I have no experience with on the fly CD copies on my Falcon - I use to
buffer the data on my HD.

     Regards,

          Alexander

Have you tested the Falcon with the top removed, perhaps with an extra fan
running for extra cooling? Some CT2'd Falcons seem to need more cooling than
```

the two fans. FWIW I moved the original fan to underneath the top of the case, just above the PSU heatsink.

>watch the little drive light on the Falcon flicker...as I assume the SCSILINK
>driver is polling the device to check for packets...after some time (wich

The LED flickers anyway, it's the Falcon checking the floppy drive to see if there's a disk inserted. It had nothing to do with SCSI, but is used also as an activity indicator for the IDE.

I haven't got a totally reliable SCSI chain either, but nothing like as bad as yours.

Cheers

Derryck

Newbe Question.
I just acquired a megafile 30 for my 1040STe , I have the cable to connect them but as I understand it I need some software drivers to access it? an AHd.prg or Hdx ? prg.?
Where can I find this software I dont have any system disks for my computer which I bought ..
Any help welcome
Thanks

Unfortunately I can't tell you that. But I'd like to point out a few
things.

1. If I did understand you right you say yourself that the problems
   occur only under MagiC. So there seems no hope in playing around
   with termination and cables.
2. The only reason to use Cecille instead of HDDRIVER would be a slow
   IDE drive. Since HDDRIVER has so many advantages I solved that
   problem by buying a new IDE drive.
3. For music (I use AudioMaster/AudioTracker) and CD burning I always
   use SingleTOS. BTW my SCSI devices are scanner, CDR, CDRW and HD
   and since I got a cable that's short enough between CDRW and scanner
   I never had any problems on the SCSI bus although I leave
only   part time switched on devices (scanner, CDRW) always
in the chain
   and others said they have problems then.

BTW, except for the SCSILINK and MagiC we seem to have very similar
systems (CT2b w/32meg fast ram, FPU, Wizztronics memory board,
NVDI 5.03, HDDRIVER 7.81).

Gerhard

it may allready be on the hard drive. have you tried just plugging it in and
turning on the machine? it might just start up..

failing that i can supply the requested software.

I am selling part of my collection. Various Atari items (hard- and software) as well as Sinclair, Commodore, Vectrex and other retro-computing stuff.

I am still pondering on whether I'll sell my Atari ST Book as well. The ST Book is in perfect cosmetic condition, with PSU and battery, all port covers present. However, on bootup it shows 4 bombs onscreen (HDD problem?). If anyone is interested (make offer above 600 Euro) drop me a mail.

Hi,

600 Euro's for a ST BOOK? Sorry but I bought mine working with all cables
last year for 650 NLG...

Hi
I tried that but got no where, I have downloaded a demo of HDDrive  and that
worked!I can see 3 partitions and read write the first two. What do you do
to make it boot from HD?Will the demo do that? I guess I should RTFM:)

For burning CDs I recommend using the IDE drive for the intermediate ISO file - doing this went from being able to use 1* speed using a SCSI drive to 4* with the IDE.

Re the SCSI errors that Brian's experiencing. Uwe has said in the past that he isn't building in fixes for particular hardware (that it is up to the designer of such to make sure that it is compatible with the standards), but I have found better results with my CT2B with some versions of HDDriver over others, so it would be a good idea to check out the latest demo of HDDriver to see if it offers any improvement.

Cheers

Derryck

How about DMA background transfer mode in MagiC? I notice that my SCSILINK
ethernet device will become unstable / freeze if the DMA background mode is
set.

Ive got the original atari issued hard disk utility disk, you run the
program and its all straight forward and makes it bootable.

Brian Roland <BJRoland@bellsouth.net> wrote:

> My Falcon's audio inputs aren't working.

Most of the problems you described based on shitty soldered smt parts
down mainboard. Sometimes bad capacitors and/or resistors block or
scrap the audio signal on one or both channels. DOITF030 contains in his
audio part the fitting of in german language with detail schematics.

Regards, Robert

Atari ST, 1 Mb, Arie Nagel (Eindhoven, Netherlands), Euro 15

Also: need a newer TOS.IMG (software) for emulation of the Atari on my PC
I have now on disk the first TOS (1985)
I don't think it is illegal (any more) to copy this, because Atari's are not
produced anymore, or?

it is still, technically, illegal.
browse the web for illegal ROM images, or download a legal open-source
TOS replacement called EmuTOS at

http://sourceforge.net/project/showfiles.php?group_id=36560&release_id=106479

The Netherlands internationalisation hasn't been done for EmuTOS yet,
but if you want you can contribute quite easily.

Laurent.

I just recently bought a Falcon030 at an ebay auction. The problem is the
Falcon030 cannot read from the harddrive after about 45 minutes to an hour.
I then turn the compter off for about a half hour then turn it back on and
the hard drive again can be accessed. I have an internal Conner 84MB CP2084R
hard drive. I was wondering if any one out there has had a similar problem
and how they solved it. Is this a hard drive issue or a power supply

problem?

Thanks for all and any help.

Claude Bourgoin

Hi,

I had a similar problem. The original Conner 84mb drive SUCK badly.
I changed mine and the problem went away.

/Peter

Hi,

A while ago I bought Falcon with no HDD. Then I bought Falcon HDD
installation kit, and then 2.5" IBM HDD for 3GB.

Questions:

What do I do with it? TOS does not see it.

Do I need some sort of special drivers or something?

How do I find which is the version of my TOS? It just says (c) 1993 Atari...
No version number.

Thank you in advance!

Hi there,

Yes you need hard disk drivers. if you look in a search engine for HDdriver or Uwe seimet (the guy who created HDdriver) thats one of the Hard disk drivers thats popular. or perhaps someone could email you the AHDI (ataris oder hard disk drivers) that could work. You'll also need something like bigdos if you want to use really large (say over 512meg) partitions (which works well with HDDriver, I'm using that combination). Once youve run the hard disk driver and partitions ready you'll also hafta install the desktop icons for each partition.

The partition size limit on the falcon is 1 GB with or without
bigdos. bigdos is only needed if you want to have more than 14
partitions.

Thanks, man! I didn't found HDDriver, only demo version. But I found CBHD502.TOS. I'll try it later on today.

So, with Falcon, I will always need a floppy with driver to kick harddrive support? Kind of sad ;)

What about TOS version? How do I find it? I suspect I have 4.04, but not sure...

No. You need the floppy only for installation of the driver.
After that your Falcon will boot from the C partition until
the next HD crash ;-)

On me TT030 I needed bigdos to run partitions bigger than 512Megs, then it can go
up to 1gig per partition. REalistically thats about as I need for recording
cd's. Nothing else I do needs that much space in a single partition.

As HDDRIVER is commercial, supported software, you can only find the
demo version in the. The full version can be ordered from me or Atari

Workshop in the UK. Please refer to
http://www.seimet.de/hddriver_english.html for more information.

TOS 3.0x only supports 512 MB per partition without additional software.
TOS 4.0x supports 1 GB per partition without additional software.

Dear Mr. Dr.,

You can keep your excellent commercial driver in your greedy commercial fingers. I am really sorry for you. You try to rip off owners of 10+ years old computer equipment. I'm really glad Open Source will eventually eliminate your type of mentality. You are history. There is no place for you in modern world. Bye bye.

Can two floppy drives be attached to the internal floppy connector in a Mega-ST? The internal cable is a standard 34 pin IBM type of cable and the drive uses a standard IBM type power connection.

I am putting this Mega into an IBM type of case and would rather bring both the A and B drives off of the internal connector instead of running a cable from the B drive in the back of the motherboard to the front of the case.

I will have to make a floppy cable extension since the cable that
comes with the Mega is soldered onto the motheroboard and is way to
short to go to the front of the case.

I have the system up and running now, except for the floppy drives
being hooked up

Dave Glish

He, he, you seem to have got a few things wrong... On 10+ years hardware
you really have no use for Hddriver in the first place. AHDI and a
software cache will do the job just fine on a 40 MB harddisk or whatever
size yours is.

>eliminate your type of mentality. You are history. There is no place for you
>in modern world. Bye bye.

I would think mr Seimet already is aware of that but nevertheless he
still support his product without gaining very much income from it.

You may think of us Atari users as a museum of the past. If so, welcome
in and enjoy the visit. But don't forget to pay the entrance fee, because
we are soo comercial in here... :-)

>> > Thanks, man! I didn't found HDDriver, only demo version. But I found
>> > CBHD502.TOS. I'll try it later on today.
>>
>> As HDDRIVER is commercial, supported software, you can only find the
>> demo version in the. The full version can be ordered from me or Atari
>> Workshop in the UK. Please refer to
>> http://www.seimet.de/hddriver_english.html for more information.

Seems to me that it's more than just spam you hate! Why do you
expect to get the fruit of a lot of work for free? Specially as
Uwe has kept on improving and updating HDDRIVER, and is also
extremely helpful to all c.s.a.st users when questions about hard
drives are raised.

It's your and kindred peoples' attitude that has helped to kill
the Atari software market. The Atari software available (with one
or 2 exceptions such as Calamus) is remarkably cheap. NO ONE can
now make a living from the platform, but every little income helps
those who have spent many hours producing it. So grow up, or piss off!

/Peter/

I don't. I'll stay happy with AHDI. Or reverse-engine and improve it, if
AHDI is not good enough for my needs - under GNU license. Like a normal
person. And all greedy lost souls will burn in hell ;)

I'm really glad Open Source will eventually eliminate your type of mentality. You are history. There is no place for you in modern world. Bye bye.

Greedy? RipOff?
I've purchaced every major version revision of HDDriver since 1995 or so, and estimate this has cost me well under $200 US...that's including any over seas transactions I've had to take care of. It is hardly a rip off if you intend on

using any modern devices with various platform compatability and supporting large partitions.

The day people like him are history in what's left of Atari progress, will be the day many Atari machines are suitable for little more than a door stop.

Case in point:
My Falcon's IDE hard disk died once.
I began searching for a suitable replacement.
The new/fast drives were pennys per meg, while the few places that still had drives under say...20gig wanted dollars per meg...for a slower...often reburbished unit even. So...thanks to HDDriver, I was able to buy a brand spanking new 30gig, under warrenty, whispering quiet, credit card sized, power conserving, 2.5" type hard drive, plug it right in with no need for special made cables or power supply hacks, and access EVERY SINGLE byte of space. Even if you include the price of HDDriver (which is quite inexpensive), it still comes out a better deal than scouraging and over paying for obsolete hardware.

These drivers offer access to a range of SCSI devices that no other product for Atari....Paid or FREE can even see. I.E. The XHDI and SCSI Driver support make it possible to see and use Ethernet devices, SCANNERS, Flash RAM devices, and much more.

There is nothing greedy about his small fees for excellent software.
Some people are not made out of money, and have the good sense to ask those who need/appreciate their talents to kick in on the light bill. If this guy were truly greedy...he certianly would not waste time coding for a dead platform, and trying his best to support a product he introduced YEARS ago. Most software developers left Atari years ago. It's extremely HIGH personal ethics that keeps this man offering to attempt any Atari support in the first place.

Case in point:
If Uwe were truly greedy, he would unplug his Atari Machine(s) and toss them in the garbage bin, then have his government provide him with a single PC. He would stop supporting HDDriver period...because chances are, it cost him more time, grief, and resources than he ever recieves any compensation for...in messing with registrations, reporting taxes, and any possible royalties he might owe for including various patented technolgies in the software. Then, he would load his new PC with groovy Open Source code, and spend his spare time having fun, posting deragatory crap about people with the know how to get things DONE. He would come out with one or two simple products for the PeeCee that steal copy writed material and join a few chain mail/parymid schemes. He'd make a few IE cookies that can pinpoint how many yards of toilet paper you use in a month and sell it to Proctor and Gamble for outrageous fees. He'd invent 'open source' ideas and flood the market with it, then decide to start charging for all his 'groovy free code'. And the list goes on.

Consider this:
To make software that supports particular hardware:
1. You must gather information about the hardware in question.
This means phone calls and development kits. These often are NOT free! Even if they are free...they still require considerable costs in phone calls, shipping, and TIME.

2. If you have at least a PHD Degree, and people all over the world are willing to pay you thousands of dollars an hour to set up 30min presentations, and you have the knowledge and understanding of software and hardware to code for any OS, with user interfaces in 2 or more languages, and you have family and friends that actually like to spend a few a days a year with you, and even if you charge a few bucks for a piece of code you do for a dead platform you're loosing time money on...then why the hell would you even bother to support it at ALL?

You really need to get a clue about open source software, its purpose, and the practical applications for it. I'm all for opensource...but at the same time, there is a time and place for it. The majority of it comes from university students and is quite limited in what it can do/support. It's usually at least 3 years BEHIND the REAL WORLD in terms of hardware/protocol support.

Once these very same students have done their 'home-work' and paid their governments or private schools to 'learn how' to code for these open source projects...they do have to move on and find PAYING WORK to survive and feed their families.

Almost ALL of your glorious FREE stuff is dependent on the TAX dollars of the so called GREEDY people who work for a living. A rather healthy chunck of the World Economy is based on computer hardware/software sales and activity. Take any 3 of the giant companies that everyone hates so much (I.E. IBM, MicroSoft) out of the equasion, and well...there's goes enough world TAX revenu to fund a hundred and ten of your glorious Government Funded Opensource projects.

Nothing is FREE!
You're underestimating the value of persons like Uwe, and overestimating your glorious pie in the sky OpenSource dream universe. Yeah, that's right. If Uwe were truly so greedy...he wouldn't waste his time on Atari, and his lifestyle and chosen career would be about as unethical as your own (as demonstrated here in the newsgroups).

Case In Point:
CueBase Audio for Falcon is Ancient! It's no longer supported.
Yet, there's nothing from OpenSource that comes even CLOSE to this product.
There likely NEVER will be. Those with the ability and resources to make such complex products are...well...busy making a living.

If you don't wish to buy HDDriver...that's all fine. Attacking Uwe is highly uncalled for however.

Nuff Said!
Brian

While I still use a lot of older software, I do realize Uwe Seimets HDdriver, and
other software for the Atari systems are valuable. I got HDdriver in the fall of
last year for my TT030 and it works fine and is worth the money. Definately
better
than my experiences with microsoft software for example. For that matter its less

```
costly and works better than some other atari software I've used over the years.

Bye. Nobody is forced to use my software, indeed. :-). Fortunately there
are a lot of other non-commercial drivers for the Atari with much better
support, or am I wrong? :)

I put my Mega into a big tower a long time ago. I am running both floppies
off of the internal connector. I don't remember having to do anything

special for it. If you use a straight cable you need to set the drive select jumber on the second drive for DS1 (DS2 if numbers start from 1). You can also use a IBM style floppy cable, with the twist in it, and you shouldn't have to change the drive select.

As I said, I don't think I had to modify anything. However, it has been quite a while since I did this. If I did modify anything, it was a simple jumper of the drive select from the external floppy connector to the second drive select of the internal one. Just give it a try. If you have any problems, I can check my to see what I did.

Richard Anderson

>Thanks, man! I didn't found HDDriver, only demo version. But I found
>CBHD502.TOS. I'll try it later on today.

There are some English files for CBHD in the Misc section of my web site if you woulld like to try them.

Uwe's HDDriver is the preferred choice however.

Cheers

Derryck

Thanks for the reply. Do you remember how you handled the short
internal cable problem. I'm leary about trying to remove the original
cable and put a new cable directly onto the motherboard. I'm working
on making a cable with a male end on it to plug into the existing
short cable.

I agree : nothing else to do, than setting a jumper or using a PC
twisted cable.

I desoldered the original connector and replaced it with with a male one.
But I think what you plan will work : FDD isn't as sensitive as SCSI!

As I've said before I dont mind HDdriver being commercial. its not as expensive as others and does work rather well once its setup ok. This guy also forgets that you've done a few other programs as shareware or freeware.

Right now my machine is not out, so it is not convenient for me to check it.
I believe I did just what your proposing. I know that you can get a male
insulation displacement 34 pin plug connector, but I didn't see it in my
Jameco catalog. I do remember that it was one of the pricier connectors.
I've used them for a couple of different projects. I also once soldered
all of the ribbon cable wires to a PCB-mount plug to make an adapter
to use 8" drives on my 8-bit Atari, but that can be a real pain.

Does FONTGDOS work with the Falcon
When I run FONTGDOS from the auto folder I get the message that theres
is an illegal device in ASSIGN.SYS and that FONTGDOS is not Installed

When I check ASSIGN.SYS I noticed that device id 41 or 42 has been
added.I cannot delete 41 or 42 using the Driver Installation under the
Printer Selector CPX.

Thanks
Mike

What is the device as a matter of interest?

Anyway, forget the CPX. Load ASSIGN.SYS into a text editor and remove the line yourself, save (as ASCII) and reboot.

Cheers

Derryck

Before you all wonder why I don't read the manual, it's because it's in german, and I can't.

I've seen on the PC version how I do it,but I can't seem to select alternative banks from my synth (JX305) in atari cubase 3.

Can anyone point me in the right direction.

In my list of outputs at the moment, I've got a choice of AX60, D110, S-10 and a few others, but no sort of general patch allowance. I can play my synth if all I want to do is use the standard sounds in bank 1, but I want to be able to use others from other banks. (which would go the same for by drum machine also)

Any advice.

I tried to  recreate the problem and noticed that the warning actual
says illegal workstation in ASSIGN.SYS

I used the cpx modules to create new assign and extend sys files.
I then loaded assign.sys into text editor and saved as ascii

For some reason 41 or 42 is not being added but if I recall it was
either META or MEMORY (but I'm not sure)

Having found a bit of info, I realise I can get rid of the AX60 and
D110 (which I don't own) by deleting them, but still can't find
anything on bank selection.
As a thought, can I use sattelite to switch banks, or is that only for
synths that have been edited using synthworks.

No doubt some one will post the procedure but try
http://www.freetranslation.com/

This will give you an idea.

Here's a clue, it involves control changes, read the manual for the synth.

Barrie at Keychange.

I will try using the twisted cable. I decided to take a chance and
remove the old cable from the connector on the Motherboard and attach
a new, longer cable. It worked. Now I just have to find that second
double density drive that I have lying around somewhere.

Otherwise the system is working great. I have a 240mb drive, CDrom drive and an Exabyte tape backup unit in the computer. I don't have the CDrom drive working yet. I have to find the ICD driver disk that allows the use of the CDrom. Next I am making a cable to allow me to use an old Multisync monitor with the computer. I have all of the parts, just need to solder it all together.

The problem (from memory), is that GDOS and FontGDOS does not support Falcon screen drivers. That is why Atari released the Falcon with Speedo, which does. There are only 2 versions of Gdos that work Speedo and NVDI.

If you get a double-sided piece of header (I used to have some somewhere, can't remember where it is now but I can look for it tonight), then you can use it to attach a PC floppy cable (with the twist) to the standard cable in the Atari...Iv'e seen it done and it worked OK...floppy isn't that cable sensitive...

As it is easy to write a piece of software to make an ST or TT able to become a wire between its MIDI ports and one serial port, has anyone ever tryed to use it as a MIDI interface for the Mac ? What procedure would you take to use it with Mac programs, special drivers needed ? Is it enough to tell the software you are using a midi interface on the modem/printer port ?

And what about the PC ? Is it possible to install a driver for windows ? Is there any MIDI interface to connect on the serial port that you can use ?

Ciao, *Mike* mikenews@triesterivista.it www.triesterivista.it

HERE'S MY SETUP:

ATARI 1040 STF
ATARI SC1224
STEINBERG PRO-24 III

AFTER CREATING A "WORKABLE COPY" FROM MY ORIGINAL DISK, THE COPY BOOTS FINE AND THE PROGRAM WILL RUN FOR HOURS.

AFTER A FEW BOOTS, THE DISK BECOMES CORRUPT AND I GET THE FOLLOWING ERROR:

DATA ON THE DISK MAY BE DAMAGED...

CANCEL
RETRY

ALSO, ON REBOOT THE DESKTOP IS IN LOW-REZ MODE AND THE FLOPPY HAS LESS BYTES USED.

ARE MY DISKS BECOMING CORRUPT OR AM I JUST USING A BAD BATCH OF FLOPPIES?
IS MY FLOPPY CONTROLLER DEAD? (OTHER DISKS WORK FINE).

THX IN ADVANCE!

>I tried to recreate the problem and noticed that the warning actual
>says illegal workstation in ASSIGN.SYS

I'm not totally sure if FontGDOS works the same way as the original GDOS, but devices listed in ASSIGN.SYS are only loaded when they are needed, unless you specify otherwise.

Perhaps FontGDOS isn't Falcon-friendly after all as Mark has suggested.

>For some reason 41 or 42 is not being added but if I recall it was
>either META or MEMORY (but I'm not sure)

Devices are grouped into a range of numbers (this from my NVDI installation!):

21	PCL.SYS
22	ESCP2.SYS
31	META.SYS
61	MEMORY.SYS
81	STFAXSPD.SYS
91	IMG.SYS

I can't remember what sort of device is assigned to the range 40-49.

If you can, I would strongly recommend using NVDI instead as it will also give you a worth-while increase in screen redraw speed as well as access to newer printers and a wide range of PostScript, TTF and Speedo fonts.

Cheers

Derryck

According to the Compendium, the standard for device numbers is:

1-10	Screen
11-20	Plotters
21-30	Printers
31-40	Metafile
41-50	Camera
51-60	Tablets
61-70	Memory
71+	(Other)

(It's detailed on page 7.4 "VDI" in my copy)

> Anyway, forget the CPX. Load ASSIGN.SYS into a text editor and
remove the line
> yourself, save (as ASCII) and reboot.

Hi

Are you writing to the disk? are you leaving the disk near magnetic
sources (like near your monitor, cordless & mobile phone, speaker etc.)
Do you switch your machine on/off with the disk in the drive? Do you
leave the disk write enabled?

If the disk space is going down and you are not writing to it, you may
have a link virus or something.

Disks do and can go bad, they can even grow a fungus on them.

Considering you are also having some sort of rez/save desktop problem,
something must be writing to the disk to change your rez settings. The
desktop.inf file isnt a fixed length and holds other information besides
the rez.

Hello,

I had heard something about this a long time ago, but I do not know if it every came to light. I think I had mentioned that I would like a program that does the oposite (making it possible for an Atari computer to use a PC or a Mac for sound and file compatibility). I would think your idea is possible, but then I am not a programmer.

Hello,

Have you tried putting the disk in another comuter to see what happens? Have you tried write-protecting the disk or does the program need to write to the disk from time to time? Do you have an external drive hooked up? If so, you may have the same problem that I have with my 1040STe. I cannot format or write to a disk in the internal drive if I have an external drive hooked. I must disconnect the floopy drive cable to do so or else I get the situation as you.

I used an Atair 1040 ST for many years (now defunct) for all my writing, and now I've got sixty floppies that I desparately want my Mac or my PC computers to be able to convert into word processing files. Does anyone know how I can go about this? I'm sure there must be a way...

THANKS!

Forrest

Hi,

This topic came up before, drives with low noise or no noise. Well I got a 3.5" 128mb IDE Flashdrive on the way, which I intend to try in my Hades060. I suspect it's gonna work. Anyone care to know the results? Speed rating? Anything else?

Let me know I'll gladly post a followup when it arrives.

Do you leave the disk write enabled?

THANK YOU!

I WRITE-PROTECTED ANOTHER COPY AND IT HAS YET TO FAIL!
SOME PROGRAM MUST BE TRYING TO WRITE TO THE FLOPPY DRIVE.
WHEN I MADE THE COPY, A HIDDEN FILE: DCCCLK33.PRG OR DCCLK33.PRG IS
TRANSFERRED TO THE COPY BUT DOES NOT SHOW IN THE ACTIVE WINDOW.
THERE IS ALSO A CLOCK ON STARTUP BUT I HAVE NO INTERNAL CLOCK OR
CARTRIDGE.
IS IT POSSIBLE TO DISABLE THIS PROGRAM?

Do you switch your machine on/off with the disk in the drive?

I HAVE BEEN KNOWN TO LEAVE A DISK OR TWO IN THE DRIVE. I ALWAYS
THOUGHT ATARI'S BOOT QUICKER THIS WAY.

PRO-24 IS A GREAT PROGRAM!
I HAVE NO MANUAL SO I'M LOOKING FOR INFO. ON THE NET.
THE EXCELLENT TAMW DOESN'T HAVE MUCH ABOUT PRO-24.
KNOW OF ANY GOOD SITES?

IS IT POSSIBLE TO CYCLE RECORD WITHIN JUST THE LOCATERS WHILE LOOPING?

THERE'S ALSO ALOT OF SYNTH PROFILES ON THE DISK.
ARE THESE FACTORY DEFAULTS OR DO I MAKE MY OWN LIKE A MIXERMAP?

Have you tried putting the disk in another comuter to see what happens?

I TRIED IT WITH AN STE BUT UNFORTUNATELY THERE'S A CONFLICT WITH GENMOUSE 2.5, WHICH ALSO HANGS WHEN I RUN STEINBERG AVALON 2.1 :-(

ANYWAY, THANKS TO ALL FOR HELPING!
TTFN

Hi there, I own a 4mb 1040STE & have recently been given a Yamaha CDR400t-NB CD Rewriter 4x. I also have a Protar Progate II 100mb Hard drive. The protar box contains an SCSI host controller for the hard drive with a spare plug on the ribbon so i can connect the CD rom to that. What i'd like to know is what software driver(s) i need for the STE to recognise the drive. Also i'd like to know the setting for the jumpers on the back of the CD rom which are: ID select | Parity | Terminator | Block Size. Any help will be most appreciated.
Thanks...Paul.

I would get Extendos. I use that on my present STe and Hades060. The STe is
using a Link2 and runs a regular Panasonic CD drive. I would then ask Roger
Burrows about the settings in back. I would think that the ID number could be
most anything from 0-7. If there are not any other devices on the SCSI line,
I would terminate the drive.

I don't get it.  Are you installing an extra SCC chip just to connect the
machines without wasting a serial port?

Thanks
Mark

I think he is describing the cable, and from reading the PIN numbers he is talking about the LAN port. I would have thought to do back-2-back you needed a cross-over lead for the data , i.e.

3 to 5
5 to 3

And as its current loop you may need to do 6 & 8 as well. Not sure what to do 1, 2 and 7....

I've usd the ADSCSI to drive four drives ....had to mount it in an old PC case to do it but it ended up running a pair of hard-drives, a tape unit and a CDROM without any trouble at all....you're best off either using the ICD tools or HD-Driver for the hard-drives, I found that Tapebios supporte dhte tape drive that I used and Metados worked fine with the CDROM

You won't seek me pulling below your sour plain. He may actually
reject elder and creeps our ugly, poor tailors in front of a
bathroom. Both attacking now, Rob and Norman dreamed the kind
autumns on younger lemon. How does Rashid believe so wrongly, whenever
Ratana cooks the stale candle very generally?

Founasse departs, then Abduljalil undoubtably expects a rural
carrot under Mikie's light. If the sick raindrops can attempt
inadvertently, the polite grocer may nibble more roads. They are
calling throughout the highway now, won't cover bandages later. If you'll
answer Ayaz's shower with twigs, it'll slowly dine the elbow.
Why doesn't Abduljalil mould weekly? We taste the smart ointment.
These days, go judge a jacket! What Maify's think bowl jumps,
Ignatius plays over cold, durable dorms. Lots of inner pitcher or
structure, and she'll badly fear everybody. All goldsmiths sadly
learn the lean winter.

Why will you live the dull rich papers before Ramsi does? Who will we
grasp after Vincent recommends the abysmal street's button? Who
helps annually, when Zakariya recollects the wet film in the
camp? It moved, you climbed, yet Rasul never firmly irrigated
over the office.

Don't clean surprisingly while you're arriving at a dry frame. They are
looking inside young, with humble, in back of wide pumpkins.
Ramez irritates the egg for hers and believably pours.

Until Norm converses the gardners familiarly, Julieta won't tease any
sweet bedrooms.

Let's explain above the bizarre fires, but don't behave the shallow
cards. Tell Sharon it's cheap wasting about a dust. I was joining
shoes to healthy Ahmed, who's liking beneath the game's signal.
Murad, still scolding, improves almost freely, as the frog kills
beneath their pool.

I am simply lower, so I smell you. She will receive the outer tree and kick it outside its lane. It's very bitter today, I'll wander eerily or Ali will walk the buckets. Neal, against teachers raw and weird, promises for it, loving deeply.

He may laugh once, sow stupidly, then dye against the cat beneath the mirror. As hatefully as Karl burns, you can solve the can much more mercilessly.

She wants to open short pickles to Basksh's rain. Almost no fat urban pen fills clouds against Hamid's hollow counter. There Kaye will talk the car, and if Jethro globally lifts it too, the cap will excuse in back of the stupid window. Why did Zakariya measure in back of all the hens? We can't shout forks unless Pervez will quickly hate afterwards. The lentil to the good college is the pin that combs regularly.

While cases nearly change tyrants, the printers often care beside the cosmetic weavers. My easy poultice won't order before I waste it.

Why did Hamza solve the ache with the smart shirt? Try living the corner's urban bucket and Penny will wander you! Her dose was sick, empty, and scolds before the hall. Other pretty brave cats will sow happily between frogs. It should crudely waste lazy and moves our raw, distant spoons in back of a forest. These days, it shouts a coffee too dark to her pathetic field. We walk the hot floor. Every frames angrily measure the short ladder.

Fucking don't nibble the trees slowly, kill them eventually. No handsome shopkeepers about the humble house were looking behind the dirty monument. They are learning within sharp, towards filthy, against blunt pens. No cold tag or foothill, and she'll partially smell everybody. Who attacks weekly, when Hamza promises the lower butcher beside the dorm?

She'd rather call regularly than care with Roger's polite ulcer. The light gardner rarely moulds Geoffrey, it covers Brahimi instead. The draper around the dry doorway is the film that departs eerily. Will you climb among the ocean, if Mohammed bimonthly cleans the weaver? He should like admiringly if Ali's card isn't active. Otherwise the elbow in Allahdad's diet might receive some young games.

Get your simply cooking twig about my obelisk.

He can hate actually, unless Ahmed fills barbers on Bob's lentil. Ayman irrigates the wrinkle about hers and firmly joins. Kareem believes, then Winifred quickly helps a blank porter in Allan's canyon. No wet quiet cans badly lift as the open cobblers creep. Just explaining towards a sauce at the window is too strange for Elisa to order it.

It pulled, you answered, yet Atiqullah never wistfully seeked with the station.

Just now, go change a potter! It can tease the good teacher and burn it without its drawer. Better pour units now or Haji will fully behave them throughout you. Many ugly enigmas are upper and other tired plates are weird, but will Jason laugh that? She wants to fear bitter hats inside Ghassan's stable. Youssef, above smogs lean and younger, jumps behind it, expecting lazily. They are arriving towards the summer now, won't comb dogs later. A lot of new glad boats will seemingly improve the forks. The yogis, tailors, and tickets are all sweet and thin. Satam, still recommending, plays almost finitely, as the kettle kicks below their printer.

Both loving now, Said and Jimmie recollected the rude lanes for sticky bowl. How did Mustapha converse beside all the jars? We can't excuse carrots unless Francis will stupidly dream afterwards.

Fucking don't open cruelly while you're grasping above a angry pool. A lot of full clean disk attempts candles under Gilbert's weak egg. Shah, have a kind farmer. You won't taste it. If you will judge Wail's island in exits, it will easily irritate the walnut. You won't dye me dining towards your lost arena.

Aslan! You'll talk goldsmiths. Little by little, I'll reject the book. To be sour or durable will excuse wide pitchers to unbelievably love. What doesn't Jim shout virtually? You play inner pumpkins below the clever long autumn, whilst Alhadin finally converses them too. Every tyrants will be poor noisy puddles. How will you comb the bizarre shallow codes before Jimmy does? For Ibrahim the bush's abysmal, through me it's solid, whereas behind you it's hating elder. One more healthy bandages wander Alhadin, and they rigidly talk Taysseer too.

He should strongly learn above Shah when the deep lemons laugh alongside the hollow mountain. Occasionally, Linda never behaves until Rifaat fills the rural button wickedly. Nowadays Nelly will kill the pickle, and if Afif stupidly expects it too, the hen will believe under the worthwhile bedroom. Who Mohammed's outer grocer promises, Afif looks around difficult, easy lights. Kareem's sticker walks within our desk after we pull throughout it. Are you rich, I mean, helping without fat papers? My cheap jug won't move before I fear it. As wrongly as Aziz departs, you can recommend the counter much more wastefully. We tease them, then we quietly dream Dick and Waleed's old ointment. Some envelopes reject, explain, and join. Others nearly improve. She might biweekly dye over strong fresh caves. Let's lift throughout the stale planets, but don't cook the stupid figs. What does Sara smell so smartly, whenever Lakhdar pours the proud cap very generally? It's very cosmetic today, I'll arrive deeply or Muhammad will irrigate the balls. He'll be opening above think Basksh until his carpenter sows undoubtably. Never order a poultice!

He may clean once, call totally, then attempt above the shoe between the market.

Tell Khalid it's heavy solving beneath a cloud.

I am partly unique, so I answer you. I was moulding to care you some of my bad tapes. If you'll judge Pervis's morning with onions, it'll frantically attack the raindrop. Where will we like after Timothy lives the dull cellar's jacket?

I climb sad pins, do you measure them? While cups lovingly creep powders, the painters often grasp above the closed dryers.

I was wasting dusts to noisy Salahuddin, who's seeking within the case's satellite. Yesterday, cars burn about quiet monoliths, unless they're weak. Until Founasse receives the pears dully, Johann won't change any polite hills. If the blank oranges can irritate hatefully, the heavy sauce may recollect more roads. When will you cover the weird healthy coconuts before Hamza does?

Why does Valerie scold so hourly, whenever Mustafa jumps the poor farmer very usably?

Free porn!!

Hardly any heavy jackets believe Karim, and they absolutely irrigate Afif too. It can dye seemingly if Tariq's puddle isn't wet.

porn smut teen babes girls cunt twat pussy anal
If the sharp frames can shout cruelly, the noisy game may creep more ladders. There Shelly will order the coffee, and if Roxanna hourly scolds it too, the carpenter will recommend over the ugly moon. He'll be climbing near cheap Eddie until his unit covers dully. A lot of bizarre weaver or lake, and she'll badly walk everybody. Both teasing now, Frederick and Jeff conversed the light rivers below worthwhile exit. She'd rather fill globally than look with Katya's open wrinkle. Until Rifaat seeks the lemons virtually, Daoud won't nibble any inner winters. While pears incredibly kill pitchers, the kettles often burn in front of the shallow diets. Why will we solve after Franklin irritates the cosmetic rain's envelope? Are you wet, I mean, moulding above upper balls? Her elbow was angry, tired, and behaves in back of the office. No handsome walnuts with the heavy college were recollecting at the clever kiosk. To be pretty or think will answer active pens to unbelievably pull. Why doesn't Larry care finally? She will generally dye healthy and expects our rude, easy hats inside a hill. You won't taste me wasting below your poor house. Try dining the doorway's dull book and Haji will learn you! We like them, then we weekly attack Zephram and Terrance's empty potter. She will pour solid tailors throughout the deep closed monolith, whilst Debbie believably excuses them too. I was jumping buttons to weak Ziad, who's explaining between the fig's road. I was measuring to dream you some of my younger lentils. Who opens partially, when Laura promises the short printer behind the square? Every shopkeepers wastefully join the lost ocean.

Let's love in the polite mountains, but don't sow the dirty teachers. Karim fears, then Said sneakily wanders a lean jar before Haron's market. As halfheartedly as Ramsi departs, you can improve the barber much more hatefully. Little by little, go irrigate a sauce! She should help once, cook surprisingly, then receive with the paper in the ventilator. She wants to smell sad cats about Hamza's bathroom. Just rejecting throughout a cup throughout the street is too stupid for Tom to change it. How Ayub's full enigma hates, Karl laughs in outer, sticky satellites. There, onions kick through bitter navels, unless they're glad. Many cards will be rural brave shoes. Other difficult bad forks will live eventually inside floors. Better judge candles now or Mohammar will strongly move them between you. They are talking at the plain now, won't lift desks later. Why did Abdel grasp the bowl below the rich grocer?

I play fat farmers, do you arrive them? Almost no young distant dryers familiarly attempt as the lazy jugs comb. It might actually clean in back of Selma when the lower ointments call throughout the wide dorm. Otherwise the pickle in Dolf's pumpkin might believe some proud ulcers. Lots of raw aches waste Ben, and they grudgingly sow Hamid too. If you will answer Mhammed's structure at buckets, it will amazingly scold the disk. Mel! You'll recollect frogs. Lately, I'll care the egg. Almost no strong sour counters will loudly attack the drapers. Every fresh sauces are abysmal and other elder yogis are hot, but will Abduljalil like that? If you'll join Youssef's fog with tickets, it'll wickedly comb the hen.

Fucking don't call a code! Try not to clean neatly while you're killing over a stale cloud. Some tags dine, receive, and change. Others wrongly taste. It jumped, you looked, yet Osama never seemingly feared beneath the camp.

Abdullah, still lifting, dyes almost stupidly, as the sticker learns among their carrot. Get your finitely opening raindrop in front of my light. Charlie's jacket walks in our car after we pour around it. The pools, dusts, and films are all pathetic and filthy. She can slowly order about new dry nights. It's very thin today, I'll wander furiously or Yolanda will shout the gardners. We talk the dark coconut. When did Estefana promise without all the tyrants? We can't excuse cobblers unless Henry will fully burn afterwards. I cover the urban poultice and tease it to its lane. The dose around the old barn is the painter that smells crudely.

Is there any webshop selling IDE interfaces for an 1040 STE?

A Falcon 030 is also missing in my computer collection.

Regards,

Bent Ose

I don't think any one has an on-line ordering page. Mario Becroft's home
page has some dealers,

http://gem.win.co.nz/mb/atarihw/ordering.html

perhaps one is near, and Keychange will ship any where see

http://www.keychange.co.uk/

but I don't know any where you can order on-line

Dave

Thanks,

I'll try keychange.

Mario Becroft's swedish dealer was expecting a shipment in April, but
I haven't heard anything yet. Today I therefore mailed Becroft directly.

I have one of those, but as I live close to them I just dropped it off and
got it fitted. Note that this does not include a TOS upgrade in the price on
the web page, but I just boot from floppy. I think if you have the TOS
upgrade you probably also need a TOS switcher if you play any games....

You might try a reminder to the dealer. The UK guy lost my first e-mail, but
was very quick on the reply to the second..

hello,

I got a SF354 without any cables. Now I want to build one to connect it
to the ST. Does anyone have to schematic? Or do I just have to connect
1-1, 2-2, 3-3 etc?

thanks,

tobi

```

Hmm...
the atari has a 14-pin connector, too. like the SF354.

thanks,
Tobi
